| | Optional Ques | Conceptual Coverage in 65 hours (+ 25 Hr Solving) |
| | ← 🍪 SSFM Maniramya ᢏ : 🕀 | H • 42 min ago Revising portfolio management in 5hrs including every minute detail/basic se bbi basic detail) is |
| | The Saviour batch is a blessing for those students who took SFM classes two years back .The conceptual clarity in this batch is more compared to any regular classes of other faculty. I wish your classes should get better reach in the coming few days. | really an art sir You have mastered it sir I can confidently say i dont have to mug up any formula now onwards |
| | 20:30 Thank you so much. 🙏 20:34 📈 | Thank you so much sir And guys if you are in doubt whether to trust |
| | | these young dynamic Faculty or to go for the so called legends |
| 8 | Anil Gupta • 22 hr ago Why don't seniors refer teacher like you, taken classes someone, all the things were rutta even they were rank 1, just watched theire classes nd | Thave spent 20k for SFM alone and trust me they taught only what sir has taught in the lecture nothing more nothing less and their books were neither updated upto date nor were as per ICAI standards |
| | had to made own concepts, alot of time | But sir's books are also simplified and has everything covered with wide variety of qstns and |
| | consumed, even ears were fed up of listening, nd watching. | he has provided them for free dev manush hain si So you can happily trust Jatin sir |
| | Now watched two chapters , both were full of enjoyment and learning nd now going to watch | Thank you once again sir |
| | next part. | |
| | next part. – Tq , uh made mah day 💙 | |

| Basics | of Stock Market 1.1 WWW.KRIVIEDUSPACE.COM |
|---------|--|
| | PART A: Your First |
| 1. | Let's buy some vegetables |
| | |
| I) | WHEN YOU GO TO A VEGETABLE MARKET |
| - | There are large number of different vegetables |
| - | There are many buyers & sellers. The buyers & sellers negotiate to arrive at a price. |
| - | The buyer will aim for maximum bargain and the seller aims for a higher price. |
| - | The price where the transaction takes place is the price at which both the buyer & seller agrees to transact |
| - | This price is determined by factors of demand & supply. |
| II) | HOW THE PROCESS MOVES |
| Step 1: | Buyer decides what he wants to buy, say he wants to purchase potatoes. |
| Step 2: | Buyer will find a person who is selling potatoes. The potato seller ASKS for a price of ₹60/kg. |
| Step 3: | Negotiate. Now here can be multiple possibilities. |
| | (i) Buyer will agree to the price of ₹60/kg. |
| | (ii) Buyer may try to bargain and BID at Rs. 50/kg. |
| | (iii) The seller & buyer may both compromise to some extent & agree to a price of ₹55/kg. |
| 2. | When you go to stock market |
| - | You can buy or sell the shares of various companies. |
| - | Just like in a vegetable market, the price of shares are determined largely by demand & supply factors. |
| - | There are a lot of other factors as well & that's what we will study in this subject. |

| II) | HOW THE PROCESS MOVES |
|---------|---|
| Step 1: | Buyer will decide which share he wants to buy, say he wants to buy the shares of Tata Motors. |
| Step 2: | Buyer will check what price the sellers are asking for Tata Motors. Say the seller of Tata Motors' shares |
| | ASKS for a price of ₹200/share. |
| Step 3: | Again (like vegetable market) the buyer has 3 choices - |
| | (i) Agree to the price of ₹200/share. |
| | (ii) Try to bargain & BID at a price of Rs. 190/share. |
| | (iii) The seller & buyer may both compromise to some extent & agree to a price of ₹194/share. |
| | |
| | |
| 3. | Learnings from the above story |
| 1. | The price which seller asks is known as ASK RATE or OFFER RATE . |
| 2. | The price at which buyer offers to purchase the share is known as BID RATE . |
| 3. | Share price which you see on TV or stock exchange is LAST TRADED PRICE (LTP) . This is the price |
| | at which the last trade has happened. LTP is discovered using the market mechanisms of bid-ask only. |
| 4. | The difference between the Ask price (₹200) & bid price (₹190) is known as BID-ASK SPREAD (₹10). |
| | |

4. Practical Example

| 6. 1) Ex: Ex: | 2 types of Eq There are 2 types of INTRADAY CONTRAC Intraday buy say Wip First buy: 1,000 Then sell: 1,000 Intraday sell say Volt First sell: 2000 Then buy: 2000 | uity Contra contracts - (i) CTS - In intraday oro shares × 240 shares × 243 Gross profit cas shares × 700 shares × 694 | cts Intraday (same day) trades you buy & sell the = 2,40,000 = 2,43,000 = 3,000 = 14,00,000 = 13,88,000 | (ii) Delivery (unlimited period) shares on the very same day. |
| 6. 1) Ex: Ex: | 2 types of Eq There are 2 types of INTRADAY CONTRACT Intraday buy say Wip First buy: 1,000 Then sell: 1,000 Intraday sell say Volt First sell: 2000 a Then buy: 2000 a | uity Contra contracts - (i) CTS - In intraday oro shares × 240 shares × 243 Gross profit cas shares × 700 shares × 694 Gross profit | cts Intraday (same day) trades you buy & sell the = 2,40,000 = 2,43,000 = 3,000 = 14,00,000 = 13,88,000 = 12,000 | (ii) Delivery (unlimited period) shares on the very same day. |
| 6. 1) Ex: Ex: | 2 types of Eq There are 2 types of INTRADAY CONTRACT Intraday buy say Wip First buy: 1,000 Then sell: 1,000 Intraday sell say Volt First sell: 2000 Then buy: 2000 | uity Contra contracts - (i) CTS - In intraday oro shares × 240 shares × 243 Gross profit cas shares × 700 shares × 694 Gross profit I & then buy in co | cts Intraday (same day) trades you buy & sell the = 2,40,000 = 2,43,000 = 3,000 = 14,00,000 = 13,88,000 = 12,000 ase of intraday contracts. | (ii) Delivery (unlimited period) shares on the very same day. |
| 6. 1) Ex: Ex: | 2 types of Eq There are 2 types of INTRADAY CONTRAC Intraday buy say Wip First buy: 1,000 Then sell: 1,000 Then sell: 1,000 Then buy: 2000 Then buy: 2000 | uity Contra contracts - (i) CTS - In intraday oro shares × 240 shares × 243 Gross profit cas shares × 700 shares × 694 Gross profit I & then buy in co | cts Intraday (same day) trades you buy & sell the = 2,40,000 = 2,43,000 = 3,000 = 14,00,000 = 13,88,000 = 12,000 ase of intraday contracts. | (ii) Delivery (unlimited period) shares on the very same day. |
| 6. 1) Ex: Ex: Ex: | 2 types of Eq There are 2 types of INTRADAY CONTRAC Intraday buy say Wip First buy: 1,000 Then sell: 1,000 Then sell: 1,000 Then buy: 2000 Then buy: 2000 Yes, you can first sel | uity Contra contracts - (i) CTS - In intraday oro shares × 240 shares × 243 Gross profit cas shares × 700 shares × 694 Gross profit I & then buy in co elling is allowe | cts Intraday (same day) trades you buy & sell the = 2,40,000 = 2,43,000 = 3,000 = 14,00,000 = 12,000 ase of intraday contracts. d only in intraday trade | (ii) Delivery (unlimited period) shares on the very same day. |
| 6. I) Ex: Ex: np: | 2 types of Eq There are 2 types of INTRADAY CONTRAG Intraday buy say Wip First buy: 1,000 Then sell: 1,000 Then sell: 2000 Then buy: 2000 Yes, you can first sel In India - Short s | uity Contra contracts - (i) CTS - In intraday OrO shares × 240 shares × 243 Gross profit cas shares × 700 shares × 694 Gross profit I & then buy in co elling is allowe | cts Intraday (same day) trades you buy & sell the = 2,40,000 = 2,43,000 = 3,000 = 14,00,000 = 13,88,000 = 12,000 ase of intraday contracts. d only in intraday trade | (ii) Delivery (unlimited period) shares on the very same day. |

| 7. | Basic terminology |
|------|--|
| I) | LONG POSITION |
| | Long position means buying. It is represented by '+' sign. |
| | Ex: Infosys 1000+ means = I have bought 1000 shares of Infosys. Or I am long on Infosys. |
| | |
| II) | SHORT POSITION |
| | Short position means Selling. It is represented by '-' sign. |
| | Ex: Wipro 500- means = I have sold 500 shares of Wipro. Or I am short on Wipro. |
| | |
| III) | BULL & BEAR MARKET |
| | BULL MARKET — When the market is rising. (upward trend) |
| | BEAR MARKET — When the market is falling. (downward trend) |
| | |
| IV) | MARKET CAPITAL OR MARKET VALUE |
| | Market Cap = Number of outstanding shares Market × price per share |
| | Market capitalization or Market value tells us about the size of the company. |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |

PART B: The Indices

| 1. | Introduction to Index |
|------|---|
| | INDEX MEANS INDICATOR |
| - | Index gives us a GENERAL IDEA whether most of the stocks have gone up or down. |
| Ex: | CONSUMER PRICE INDEX (CPI) tells whether the price of SELECTED goods in economy has increased or |
| | decreased. |
| | Milk Vegetables Basket of Goods/ Services # Only Essential goods / Serivices Petrol / Oil Medical Care Not all the goods/Services |
| | |
| - | Similarly, there are stock index such as SENSEX or NIFTY. |
| - | These indices measure the change in price of selected group of companies |
| - | It gives us an overall idea whether the OVERALL MARKET has increased or decreased. |
| II) | SENSEX |
| | Sensex = SEN sitivity Ind EX . It comprises 30 of the largest and most actively-traded stocks on the B |
| III) | NIFTY |
| | NIFTY - NSE Fifty. This is also an index like Sensex. However, there are 50 companies in Nifty. |
| IV) | WHY DO WE EVEN NEED AN INDEX? |
| - | There are more than 6000 companies listed on BSE & 1600+ companies on NSE. |
| - | Investors are not really concerned in all the companies listed on BSE/NSE. Therefore, including those |
| | companies in the index will not be meaningful. |
| V) | SOME OTHER INDICES |
| | INDIAN Nifty IT Nifty Midcap 100 Nifty Bank Bankey etc |
| | THET IN - IN BY TH, IN BY HIGHER 100, IN BY BUIK, BUIKON COO. |

| | Get Set Go |
|-----|---|
| | PARI C: Real Trading! |
| | |
| | |
| | In this part, we will learn to operate a Demat account. |
| | It is highly recommended that students should open a Demat account. (It is very simple) |
| | This part will be practically understood in the class. |
| I) | BASIC TERMS |
| | Pay In — To put money in Demat account. |
| | Pay Out — To withdraw money from your demat account. |
| | (Note: Pay In & out is only possible from the linked bank account and not any other account.) |
| | |
| | Market Order — Order will be placed at CMP. |
| | Limit Order — Urder will be placed at a pre-determined price. (Note: Limit Orders are used to negotiate |
| | price in stock market as discussed earlier) |
| | Stoploss order — An order to sell a security at a specified price in order to limit loss. Example: Setting a |
| | SL order at 5% will limit the losses to 5%. |
| | Market Timings — 9:15 am — 3:30 pm (Pre-open at 9:00 am) |
| | |
| II) | SQUARING OFF |
| | It means exiting a position. When you buy a stock, you will have to sell it to exit from your position. |
| | Similarly, when you 1 st sell a stock (in case of Intraday short selling), you will have to Buy the stock to |
| | to exit from your short position. This exiting from a position is known as Squaring off. |
| | |
| | |
| | |
| | |
| | |
| | |
| | |

| TVM | 2.1 WWW.KRIVIEDUSPACE.COM |
|-----|---|
| 1. | Two basic conditions of Money |
| | We can Add, subtract etc. different amounts only if - |
| | The amounts are in same currency |
| | The amounts are standing at same point of time |
| | |
| Ex: | You have ₹1000 and \$10 with you. What is your total worth? |
| | Can you say I have 1010 something something NO! |
| A: | First convert \$ to ₹ (or ₹ to \$). If 1\$ = ₹80, then - |
| | Total wealth = 1000 + 80×10 = ₹1800. |
| | |
| Ex: | You have ₹1000 today and you'll receive ₹550 after 1 year. |
| | Is you wealth today ₹1550? NO! |
| A: | First find PV of ₹550. If discount rate = 10%, then PV = $550/1.10^1 = ₹500$. |
| | Total wealth = 1000 + 500 = ₹1500. |
| | |
| 2. | Calculating FV & PV – Compound Interest |
| | |
| I) | FUTURE VALUE (FV) |
| | $FV = PV \times (1+r)^n$ |
| | Where: r = Rate per period |
| | n = number of compounding periods |
| | |
| Ex: | You invested ₹100 today at 10% p.a. Find future value (FV) after 1-year and 2-year. |
| A: | FV after 1-year = 100 × (1 + 0.1) ¹ = ₹110. |
| | FV after 2-years = 100 × (1 + 0.1) ² = ₹121. |
| | |
| | $\frac{P(r)}{P(r)} = \frac{F(r)}{r}$ |
| | |
| | Note - 1/(1+r)" is also known as fV factor. |
| Ex: | Find PV if interest rate is 10%. Case 1 — Amount after 1 year = ₹110. |
| | Case 2 — Amount after 2 years = ₹121 |
| A: | Case 1 - PV = 110 / 1.10 ¹ = ₹100 |
| | Case 2 — PV = 121 / 1.10 ² = ₹100 |
| | |

| | PV of multiple cash flows |
|-------------------------------------|--|
| 1) | MULTIPLE UNEQUAL CASH FLOWS |
| ., | This is like calculating PV of single cash flows. Calculate PV of each cash flow & add them to get Total F |
| | |
| Ex: | Time (in years) - 1 2 3 4 |
| | Cash flow - 130 150 290 400 |
| A: | $\frac{PV = 130}{(1.08)^1} + \frac{150}{(1.08)^2} + \frac{290}{(1.08)^3} + \frac{400}{(1.08)^4}$ |
| | |
| | PV = 120.37 + 128.60 + 230.21 + 294.01 = ₹773.19 |
| | MULTIPLE EQUAL CASH FLOWS |
| 117 | PV = Cosh flow per period x PVAF(r %, n periods) |
| | Where PVAF = Present value annuity factor |
| | |
| | |
| Ex: | Cash flow of ₹100 p.a. will be received for next 5 years. Find its PV today. Discount rate = 8% p.a. |
| Ex: A: | Cash flow of ₹100 p.a. will be received for next 5 years. Find its PV today. Discount rate = 8% p.a. PV = 100 × PVAF (8%, 5) |
| Ex: A: | Cash flow of ₹100 p.a. will be received for next 5 years. Find its PV today. Discount rate = 8% p.a. PV = 100 × PVAF (8%, 5) PV = 100 × 3.9927 = ₹399.27 |
| Ex: A: | Cash flow of ₹100 p.a. will be received for next 5 years. Find its PV today. Discount rate = 8% p.a. PV = 100 × PVAF (8%, 5) PV = 100 × 3.9927 = ₹399.27 |
| Ex: A: 4 . | Cash flow of ₹100 p.a. will be received for next 5 years. Find its PV today. Discount rate = 8% p.a. PV = 100 × PVAF (8%, 5) PV = 100 × 3.9927 = ₹399.27 PV of Perpetual cash flows |
| Ex: A: 4. | Cash flow of ₹100 p.a. will be received for next 5 years. Find its PV today. Discount rate = 8% p.a. PV = 100 × PVAF (8%, 5) PV = 100 × 3.9927 = ₹399.27 PV of Perpetual cash flows PERPETUAL EQUAL CASH FLOW |
| Ех: А: 4 . | Cash flow of ₹100 p.a. will be received for next 5 years. Find its PV today. Discount rate = 8% p.a. PV = 100 × PVAF (8%, 5) PV = 100 × 3.9927 = ₹399.27 PV of Perpetual cash flows PERPETUAL EQUAL CASH FLOW (also known as Infinite / indefinite / forever cash flows.) |
| Ex: A: 4. | Cash flow of ₹100 p.a. will be received for next 5 years. Find its PV today. Discount rate = 8% p.a. PV = 100 × PVAF (8%, 5) PV = 100 × 3.9927 = ₹399.27 PV of Perpetual cash flows PERPETUAL EQUAL CASH FLOW (also known as Infinite / indefinite / forever cash flows.) |
| Ex: A: 4. | Cash flow of ₹100 p.a. will be received for next 5 years. Find its PV today. Discount rate = 8% p.a. PV = 100 x PVAF (8%, 5) PV = 100 x 3.9927 = ₹399.27 PV of Perpetual cash flows PERPETUAL EQUAL CASH FLOW (also known as Infinite / indefinite / forever cash flows.) PV of perpetual cash flows = Cash flow p.a. |
| Ex: A: 4. | Cash flow of ₹100 p.a. will be received for next 5 years. Find its PV today. Discount rate = 8% p.a. PV = 100 × PVAF (8%, 5) PV = 100 × 3.9927 = ₹399.27 PV of Perpetual cash flows PERPETUAL EQUAL CASH FLOW (also known as Infinite / indefinite / forever cash flows.) PV of perpetual cash flows = Cash flow p.a. Discount rate |
| Ex: A: 4. I) | Cash flow of ₹100 p.a. will be received for next 5 years. Find its PV today. Discount rate = 8% p.a. PV = 100 x PVAF (8%, 5) PV = 100 x 3.9927 = ₹399.27 PV of Perpetual cash flows PERPETUAL EQUAL CASH FLOW (also known as Infinite / indefinite / forever cash flows.) PV of perpetual cash flows = Cash flow p.a. Discount rate You found an ancient tree will live for next thousands of years (perpetuity). You can sell the herbs from |

TVM

TVM

| I) | SPECIAL CATCH |
|-----------|---|
| | Let us say that the ancient tree (from above example) will start producing herbs only after 4 years. |
| | What should be the PV of its cash flows now? |
| A: | PV = <u>Cash flow p.a.</u> x <u>1</u> |
| | Discount rate $(1 + r)^3$ |
| | PV = <u>2,50,000</u> × <u>1</u> = ₹24,80,725 |
| | 0.08 1.083 |
| | Logic of above |
| | Perpetuity formula pulls the total value of perpetual CFs to 1 yr before the starting yea |
| - | If perpetual CFs are starting from year 1, then this formula will provide us value @ Year 0. |
| - | Similarly, if perpetual CFs are starting from year 4, then this formula will provide us value @ Year 3. |
| | So, to calculate its PV we have to discount it with $(1 + r)^3$. |
| III) | PV OF PERPETUAL & GROWING CASH FLOWS |
| , | PV of Perpetual & Growing (Es = 1 st (E of arowth series |
| | Discount Rate _ Growth rate |
| | |
| Ex: | Let us say in the previous example of ancient tree, you expect annual cash flows to grow at 3% p.a. |
| | Find PV of cash flows now. |
| A: | PV of cash flows = = ₹50,00,000. |
| | 0.08 - 0.03 |
| | Same as above example. But herbs will grow after 5 years. So, revenue will start after 5 years. |
| EX: | |
| Ex: A: | PV of cash flows = <u>2,50,000</u> × <u>1</u> = ₹36,75,150. |
| Ex: A: | PV of cash flows = $2,50,000 \times 1 = ₹36,75,150.$ 0.08 - 0.03 1.08^{4} |
| Ex: A: | PV of cash flows = 2,50,000 × 1_ = ₹36,75,150. 0.08 - 0.03 1.084 |

|---------|---|---|----------------|--|
| I) | SPECIAL CASE 1 Period < 1 year | | | |
| Ex: | Interest rate for 3-months = 2%. It will be quoted as 2 × 4 = 8% p.a. | | | |
| | So, if ques mention 8% p.a. and you require quarterly | interest → Then it means 8 × 3/12 = 2% | , per quarter. | |
| | | | | |
| Ex: | Invested ₹1000 for 6-months @ 8% p.a. Find future | value @ end of 6-months. | | |
| A: | Future value = 1000 × (1 + 0.08 × 6/12) = ₹1040. | | | |
| | | | | |
| Ex: | You will receive ₹1040 after 6 months. Find its PV if | interest rate = 8% p.a. | | |
| A: | PV = <u>1040</u> = ₹1000. | | | |
| | $(1 + 0.08 \times 6/12)$ | | | |
| | | | | |
| II) | SPECIAL CASE 2 Compounding frequency spec | fically given | | |
| | Concept — The formula for PV and FV remains same | with 2 additional steps. | | |
| Step 1: | Get rate per compounding period (r) = Rate p.a. ÷ N | imber of compounding in a year | | |
| Step 2: | Calculate number of compounding periods (n) = Num | ber of years x Number of compounding | in year | |
| | | | | |
| Ex: | Amount invested today ₹1000 for 1.5 years at 10% | o.a. compounded semi-annually. Find FV. | | |
| A: | r = Rate per compounding period = 10% / 2 = 5% per | 6-months. | | |
| | n = Total number of compounding periods = 1.5 × 2 | = 3 | | |
| | FV = 1000 × (1 + 0.05) ³ = ₹1157.625 | | | |
| | | | | |
| Ex: | Amount receivable after 2 years = ₹20,000. Rate = 12 | % p.a. compounded quarterly. Find PV. | | |
| A: | r = Rate per compounding period = 12% / 4 = 3% per | quarter. | | |
| | n = Total number of compounding periods = 2 × 4 = | 8 | | |
| | PV = 20,000 / (1 + 0.03) ⁸ = ₹15,788.18 | | | |
| | | | | |
|) | CRUX (V.Imp) | | | |
| | PERIOD < 1 YEAR | PERIOD > 1 YEAR | | |
| - | FV = PV (1 + r × months/12) | $FV = PV (1 + r)^n$ | | |
| | | | | |
| - | PV = <u>FV</u> | PV = <u>FV</u> | | |
| | (1 + r*months/12) | (1 + r) ⁿ | | |
| | | | | |
| * | In case if period is in days, then it will be | Where r = rate per compounding pe | riod | |
| | days / 360 or 365 and so on | n = Total number of compou | nding periods | |

TVM

| 6. | Dirty power | | | | |
|-----|---|--|--|--|--|
| Ex: | Amount invested today = ₹1000. Rate = 12% p.a. compounded semi-annually. Find FV after 15 months. | | | | |
| A: | r = Rate per compounding period = 12% / 2 = 6% per 6-months. | | | | |
| | n = Total number of compounding periods = 15/6 = 2.5 periods | | | | |
| | $FV = 1000 \times (1 + 0.06)^{2.5}$ | | | | |
| | ~ | | | | |
| | BUT HOW SOLVE 1.0625 | | | | |
| | Such odd powers are also known as Dirty power. | | | | |
| | | | | | |
| | STEPS TO SOLVE DIRTY POWER – A ^B | | | | |
| | \sqrt{a} 12 times Enter 'a' and then press under-root button 12 times | | | | |
| | -1 Subtract 1 | | | | |
| | ×b Multiply with power | | | | |
| | + 1 Add 1 | | | | |
| | x = 12 times Press 'multiply equal to' 12 times | | | | |
| | | | | | |
| | Applying in above case -> Calculating 1.06 ^{2.5} | | | | |
| | $\sqrt{1.06}$ - 12 times | | | | |
| | - 1 | | | | |
| | × 2.5 | | | | |
| | + 1 | | | | |
| | x = -12 times | | | | |
| | <u>We'll get $1.06^{2.5} = 1.1568$</u> | | | | |
| | | | | | |
| | Hence, FV = 1000 × 1.1568 = ₹1156.8 | | | | |
| | | | | | |
| | | | | | |
| | | | | | |
| | | | | | |
| | | | | | |
| | | | | | |
| | | | | | |
| | | | | | |

|------|---|
| 7. | Spot Rates (SR) vs Forward Rates (FR). |
| I) | SPOT RATES (ALSO KNOWN AS ZERO RATES). |
| Ex: | You want to invest ₹100. Banker has quoted following SPOT rates. Find the future value of investment. |
| | 1 year SPOT RATE (r0,1) = 10% p.a. |
| | 2 years SPOT RATE (r0,2) = 11% p.a. |
| | 3 years SPOT RATE (r0,3) = 12% p.a. |
| A: | If you invest for 1 year, then future value of investment = ₹100 × 1.10 = ₹110 (easy). |
| ii) | Invest for 2 years. |
| | Earn 11% p.a. for next 2 years. i.e. Interest for 1 st year = 11% and also interest rate for 2 nd year = 11%. |
| | FV of investment = $100 \times 1.11 \times 1.11 = 100 \times 1.11^2 = 123.21$ |
| iii) | Invest for 3 years. |
| | You will earn 12% p.a. for next 3 years. |
| | $FV = 100 \times 1.12 \times 1.12 \times 1.12 = 100 \times 1.12^3 = 140.49$ |
| II) | FORWARD RATE (FR) |
| Ex: | You want to invest ₹100. Banker has guoted following forward rates: Find future value of investment. |
| | Forward Rate of year 1 (f_{01}) = 10% p.a. |
| | Forward Rate of year 2 $(f_{1,2}) = 11\%$ p.a. |
| | Forward Rate of year 3 (f _{2,3}) = 12% p.a. |
| A: | Year 1 is same. You invest and earn 10%. FV of investment = 100 × 1.10 = ₹110 |
| | |
| 11) | Invest for 2 years |
| | Earn 10% interest for 100 year (i.e. 100 year FK) and 11% for second year (i.e. 2^{10} year FK). |
| | $FV OF Investment = 100 \times 1.10 \times 1.11 = <122.1$ |
| iii) | Invest for 3 years |
| | Earn 10% for 1 st year, 11% for 2 nd year and 12% for 3 rd year. |
| | FV of investment = 100 × 1.10 × 1.11 × 1.12 = ₹136.752 |
| III) | NOTATIONS |
| | $r_{(0,2)}$ means SR for 2 years. Similarly, $r_{(0,3)}$ means SR for 3 years and so on. |
| | f(12) means FR for 2 nd uear. Similarly, f(23) means FR for 3 rd uear and so on. |
| | |

How much for a water bottle?

Mr. CA forgot his water bottle while going to his office.

Shopkeeper — Here it is sir. 1 water bottle for \gtrless 40

Mr. CA - Oh it's too expensive. Let it be. I will go back home and pick up my bottle.

After a few days...

Mr. CA went to tour UAE and got lost in a dessert. After 2 days without food & water he finally found a man selling 1 water bottle for ₹10,000. He purchased it instantaneously to save his life.

| Ē | Why it is co? To understand it we must first understand 2 terms. Value and Price |
|------|--|
| | WITY IL 13 30: TO WINGERStund It, WE THUST THIST WINGERStund 2 CETTES — VUINE UND THEE. |
| I) | VALUE |
| - | Amount determined by investor as the amount that he/she SHOULD PAY to get an asset. |
| - | This is amount that you feel is 'RIGHT OR FAIR' for the asset. |
| - | Also known as Fair value or Fair price or equilibrium value or theoretical value. |
| II) | PRICE |
| | Price prevailing in the market i.e. amount at which you can ACTUALLY BUY OR SELL an asset. |
| | In the above example, the rate quoted by shopkeeper (₹40 or ₹10,000) is the price. |
| III) | CRUX |
| | In case 1 - Value of 1 water bottle was probably less than the price (₹40) for Mr. CA. So, he didn't buy it. |
| | In case 2 - Value of 1 water bottle was way higher than ₹10,000 for Mr. CA (as his life was at stake). |
| | So, he promptly bought the bottle for even ₹10,000. |
| | |

Chapter Name Finance Acharya Jatin Nagpal (CA, FRM) 3.2 IV) OVER-VALUED & UNDER-VALUED If price > Value = The asset is overpriced & I am not willing to buy it. If price < Value = The asset is under-priced & I am eager to buy it (since I am getting discount!) V) HOW TO FIND VALUE AND PRICE? Price = Simply check what the price prevailing in the market. It cannot be calculated as such. Value = PV of expected cash inflows from an asset. From the outside, you may feel that each financial asset has a EQUITY SHARES different way of calculating its **Corporate Valuation** value. BONDS / Debentures However, you will observe that the base of every such PREF. SHARES, calculation is nothing but the **Right Shares**, Warrants present value of cash inflows. DERIVATIVES like Futures & Options COMPLEX FINANCIAL INSTRUMENTS LIKE X CDOs- Not in syllabus Roots of Valuation = **PVCI**

Understanding Return

| Unders | tanding Return | 5 | 5.1 | WWW.KRIVIEDUSPACE.COM |
|--------|--------------------------------|------------------------------|------------------------|--|
| 1. | Understanding Re | equired retur | <mark>'n</mark> | |
| | | | | |
| | TWO COMPONENTS OF REC | QUIRED RETURN | | |
| | There are different method | s to calculate the r | equired return from | a financial asset. |
| | Base of all these methods r | emains same. The re | quired return is ma | de up of two basic components - |
| | a) Risk Free return b) F | Risk premiums | | |
| | Risk-Free Return | | | Risk Premium |
| | RISK-FREE RETURN = The | return that an inve | stor will earn if he i | nvests in an absolute risk-free |
| | investment. Conventionally, | the return offered | by Govt. securities | (Govt. bonds) is treated as Rf. |
| | RISK PREMIUM = Risk premi | iums are demanded | for the risks that a | n investor assumes in a financial asset. |
| | Ex: Default risk premium. | | | |
| | | | | |
| | | | | |
| 2. | Breaking down R | <mark>f into Real R</mark> i | f & Nominal | Rf |
| Ex: | I invest ₹100 today in a Gov | vt. bond that will pa | ny me ₹105 after or | e year. Inflation in India = 3%. |
| | The total return earned by | me = 5 <mark>%</mark> . | | |
| | Inflation in India = 3%. So, c | out of ₹5 earned, ₹ | 3 is merely a compe | ensation towards inflation. |
| | So, real earning = ₹5 — ₹3 = | ₹2 only. | | |
| | As seen in the above examp | ole, the risk-free rat | e (Rf) can be broken | down into two components |
| I) | METHOD 1 - Simple Additio | on Method | | |
| | Real Rf + Inflation rate = No | minal Rf | | |
| E× 1: | The real rf in India is 4%. Ca | Iculate Nominal Rf i | f inflation rate in Ir | ndia is expected to be 5%. |
| Ans: | Nominal Rf = Real Rf + Inflat | ion rate | | |
| | Nominal Rf = 4% + 5% = 9% | | | |
| | | | | |

| Finance | Acharya Jatin Nagpal (CA, FRM) 5.2 Understanding Return |
|---------|--|
| II) | METHOD 2 - Multiplication Method (more accurate) |
| | (1 + real Rf) × (1 + inflation rate) = (1 + Nominal Rf) |
| Ex 2: | The real rf in India is 4%. Calculate Nominal Rf if inflation rate in India is expected to be 5%. |
| Ans: | $(1 + Nominal Rf) = (1 + 0.04) \times (1 + 0.05)$ |
| | $(1 + Nominal Rf) = 1.04 \times 1.05 = 1.092$ |
| | Nominal Rf = 0.092 or 9.2% |
| 3. | Which is better? |
| | Story of Kido's Gift |
| | Kido's Mom gifted her ₹1000 to purchase a special Pen that she wanted. On the gift shop she saw a beautiful keyring for ₹20. Now she wants both. |
| | Kido knows that Govt. bonds are currently providing a REAL-RISK FREE RETURN of 2% p.a. |
| | So, she can invest in Govt. bonds and have ₹1020 after 1 year. Hurray |
| | she goes to the Govt. bonds seller and demands a 2% return. |
| Q | Do you think Kido will be able to achieve his target if inflation in economy is 5%? |
| A: | Total investment value after 1 year if invested at 2% real return = ₹1000 × 1.02 = ₹1020 |
| | Price of Notebook after 1 year = ₹1000 + 5% = ₹1050. |
| | Oh this won't be even sufficient to buy notebook after 1 year. (Forget keyring) |
| | So, practically Kido is losing in this case (instead of earning anything) due to inflation. |
| Q | Will Kido achieve his objective if he demands 7% return i.e. REAL RETURN + INFLATION PREMIUM ? |
| A: | After 1 year |
| | Price of Notebook = 1000 × 1.05 = ₹1050 |
| | Price of Keyring = 20 X 1.05 = ₹21 |
| | Total funds required = ₹1071 |
| | Total investment value = 1000 × 1.07 = ₹1070. |
| | Alas!!! The investment value is still not sufficient to meet the investment objective. |
| | So, simple addition method FAILED to achieve the investment objective. |

Understanding Return

| Q | Lets try with Multiplicative method. |
|---|--|
| | Required return in this case = (1 + real Rf) (1 + inflation premium) = (1 + Nominal Rf) |
| | $1 + Nominal Rf = 1.02 \times 1.05$ |
| | So, required return (Nominal Rf) = 7.1% |
| | |
| | Let's check if this works |
| | Total funds required after 1 year = ₹1071 |
| | Investment value after 1 year = 1000 × 1.071 = ₹1071 |
| | Hurray It works. Hence, Multiplicative method is best (most accurate). |
| | |
| | Author Note — Although Multiplicative method works best. But even simple addition quite a close answer |
| | to multiplicative method. So, at some places even simple addition is also used due to its simplicity. |

|-------------|------------------------------|------------------------|------------------------------|-------------------------------------|--|--|--|--|
| | DIT RATINGS! · | <mark>- Know "H</mark> | <mark>ow risky a bonc</mark> | <mark>l is"</mark> | | | | |
| For t | nis One need to analyse (| a lot of factors | to assess the safety of | a bond. Such as - | | | | |
| - Cash e | earning capacity of the (| company | <u>~</u> | | | | | |
| - Existir | ng liabilities of the comp | any | | | | | | |
| - Indus | try understanding in whi | ich the company | operates | | | | | |
| and a | and a host of other factors. | | | | | | | |
| PROB | LEM | | | | | | | |
| An av | erage don't have much | time and knowle | dge to do all this. | | | | | |
| SOLU | TION | | | | | | | |
| To so | lve this problem, we hav | e Credit Ratin | g Agencies (CRAs). | | | | | |
| These | agencies specialise in ass | sessing the financ | ial health of a bond issu | er and assigns a credit rating to i | | | | |
| | | GENERAL HIER | ARCHY OF CREDIT RATII | NGS | | | | |
| AAA | | | Clearly, the higher the | rating is, the better the | | | | |
| AA | - Investmen | t grade bonds | company is assumed to | o be. | | | | |
| А | (Less risky) | | | | | | | |
| BBB | | | This is just like grading | system of high school where | | | | |
| BB | | | AAA is best, AA is nex | tto it & so on. | | | | |
| В | | | | | | | | |
| CCC | | | | | | | | |
| CC | - Speculativ | e or Junk bonds | Rating D is worst of al | . It is given to a company which | | | | |
| С | (carry sub | ostantial risk) | has defaulted or is exp | ected to default very soon. | | | | |
| D | | | | | | | | |
| So wł | nen a rating is assigned t | o a company's b | ond issue, the retail inve | stor readily knows how safe/riski | | | | |
| the b | onds are. For ex: If the | bonds are rated | AA -> they are quite saf | e. But if they are rated B -> the | | | | |
| carry | some good amount of | risks. | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |

| Data | Anal | lysis |
|------|------|-------|
| | | J |

Base: Learning basics of Data Analysis (Mean, SD, Cov., Correlation)

| 1. | Mean (Average / Expected Value) | | | | | | |
|-------|---------------------------------|------------------------|----------------|----------------------------------|--|--|--|
| | | | | | | | |
| l) | WHEN HISTOR | ICAL DATA IS | GIVEN | | | | |
| | Mean = Sum of | Fall items ÷ N | lumber of iter | ms | | | |
| | | | | | | | |
| Ex: | Vikram Kohli so | ored the follo | wing scores i | n his last 4 innings. | Find his mean / average score. | | |
| | Innings | 1 2 | 3 | 4 | | | |
| | Score | 30 40 | 40 | 50 | | | |
| A: | Average score | : = <u>30 + 40 + 4</u> | 0 + 50 = 40 | | | | |
| | | 4 | | | | | |
| | | | | | | | |
|) | MEAN WHEN F | PROBABILITIE | S IS GIVEN | | | | |
| | Mean =∑ Xi × | Pi or | Item1 | \times Prob.1 + Item2 \times | Prob. ₂ + | | |
| | | | | | | | |
| Ex: | Find Expected | value of Vikrai | m Kohli's scoi | re using following a | lata: | | |
| | Score: | 30 | 40 | 50 | | | |
| | Probability: | 0.25 | 0.5 | 0.25 | | | |
| A: | Average score | = 30 x 0.25 + | 40 × 0.5 + 50 | x 0.25 = 40 | | | |
| Nola | If you observe | a than you'll (| find that both | a the methods are | assentially the same | | |
| NOTE. | IF YOU OPSELV | | | T THE THETHOUS UP | | | |
| III) | WHY IS MEAN | ALSO CALLER | EXPECTED | VALUE? | | | |
| | Let us say tha | it average trav | vel time from | 1 your home to co | aching class is 15 minutes. | | |
| | If you leave y | our home by | 7:20, then you | a can expect to rea | ach your class by 7:35 (i.e. in 15 minutes). | | |
| Ŧ | Clearly, MEAN F | nelps us in form | ming an expe | ctation about som | e and hence is also known as expected value. | | |
| | | | | | | | |
| IV) | MEAN HAS A F | PROBLEM | | | | | |
| | Mean does not | , provide us ar | ny info about | the deviations. For | ex: If average score of Vikram Kohli | | |
| | is 40, then it d | oes not mean | that he will s | score exactly 40 in | his next match. His ACTUAL SCORE | | |
| | can definitely | be different fi | rom the AVER | AGE SCORE. But this | s info is not provided by mean. | | |

| 2. | Standar | d Deviatio | <mark>on (σ)</mark> | | | | | |
| | The name its | elf says: Stando | ard deviation i.e. Standard | (Mean) se Deviation. | | | | |
| | SD tells us about the Deviation from the standard (Mean) on an average basis. | | | | | | | |
| | | | | | | | | |
| I) | THE PROBLE | M - 'AVERAG | E OF DEVIATIONS' = 0. | | | | | |
| Ex: | Calculate the | standard devi | ation of Vikram Kohli's sc | ore. | | | | |
| | Innings | Score | Deviation fr | om Mean (i.e. Score — Mean) | | | | |
| | 1 | 30 | 30 — 40 |) = -10 | | | | |
| | 2 | 40 | 40 — 40 |) = 0 | | | | |
| | 3 | 40 | 40 — 40 |) = 0 | | | | |
| | 4 | 50 | 50 — 40 |) = 10 | | | | |
| | Total | 160 | 0 | | | | | |
| | Average | = 160/4 | = 40 = 0/4 = | 0 | | | | |
| | Ĵ | | | | | | | |
| | Average devi | ation = 0. This | is NOT a co-incidence. This | s is true for all the cases. | | | | |
| | THIS IS BE | CAUSE NE | GATIVE DEVIATION | S AND POSITIVE DEVIATIONS CANCELS | | | | |
| | OUT EACH | HOTHER. | | | | | | |
| | | | | | | | | |
| II) | THE SOLUTION | ON – TAKF AV | FRAGE OF 'SQUARED DE | VIATIONS | | | | |
| , | Take the sour | are of the dev | iation first and then take | square root of the final answer | | | | |
| | | | | | | | | |
| | Innings | Score | Deviation from Mean | Square of deviations | | | | |
| | 1 | 30 | 30 - 40 = -10 | $= -10^2 = 100$ | | | | |
| | 2 | 40 | 40 - 40 = 0 | $= 0^2 = 0$ | | | | |
| | 3 | 40 | 40 - 40 = 0 | $= 0^2 = 0$ | | | | |
| | 4 | 50 | 50 — 40 = 10 | = 10 ² = 100 | | | | |
| | Total | 160 | 0 | 200 | | | | |
| | Average | 40 | 0 | 50 (this is average of squared deviations) | | | | |
| | Finally take square root - $\sqrt{50} = 7.07$ | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
|))) | SD - Formu | LA (Understar | nd. don't cram) | | | | | |

|----------|------------------------|---------------------------------|---------------------------------|------------------------|--|
| IV) | SD = MEAS | URE OF 'TO | TAL' RISK | | |
| | Let us unde | rstand this v | with an example. | | |
| . | | | | | |
| EX: | Following an | se the score | s scored by Kohit Verma | In the last 4 match | iona |
| | 0.25 | 10 | 10 40 - 30 | square of deviat | $900 \times 0.25 = 225$ |
| | 0.20 | 10 | 15 40 - 25 | 6.25 | $6.25 \times 0.5 = 3125$ |
| | 0.5 | 120 | 13 23 | 623 | 625 X 0.3 - 512.5 |
| | 0.25 | 120 | 120 - 70 - 80 | 6700 | Total - 21275 |
| ٨٠ | Mean - 10 x | 0.25 + 15 × (| 15 · 120 × 0.25 - 40 | | 10tul - 2137.5 |
| <u> </u> | Standard de | viation = Sau | $1.5 \neq 120 \times 0.25 = 10$ | quared deviation" = | = 1/21375 = 46.23 |
| | | | | | ¥2107.0 10.20 |
| # | Interpretat | ion | | | |
| | Though the | average scc | ore of both Vikram & Rok | nit is same (40). But | the SD of Vikram is lesser (7.07). |
| | Whereas SD | of Rohit is a | quite high (46.23). | | |
| | If I have to | o choose on | e plauer out of the two | . I will prefer Vikrar | n as he is more stable plauer. |
| | Rohit on the | e other hand | l can be a quite risky cho | Dice. | ······································ |
| | | | | | |
| V) | CRUX | | | | |
| 1. | SD = 'Avera | ige Squared (| deviations' ka Square roc | ot. | |
| 2. | SD is measu | re of TOTAL | . RISK. Higher the SD, the | riskier an item is. I | Hence, in stock market, we prefer |
| | stocks with | lower SD (o | ther things remaining sa | me). | <u> </u> |
| | | | J | | |
| 3. | Varianc | <mark>:e (σ²)</mark> | | | |
| | Variance = S | quare of sta | andard deviation | | |
| | or simply – | 'Average So | quared deviation'. | | |
| | Variance = <u>></u> | $E (x - \bar{x})^2$ | Or $\sum P(x - \bar{x})^2$ | | |
| | | N | | | |
| | | | | | |
| Ex: | SD of a sto | ck is 15%. Fir | nd its variance. | | |
| A: | Variance = (1 | 15 %) ² = 22 | 5 % ² | | |
| | | | | | |
| Ex: | Variance of | a stock is 40 | 00%². Find its SD. | | |
| A: | SD = √Variar | nce = √400 | = 20% | | |
| | | | | | |

| ance | Acharya Jatin Nagpal (CA, FRM) | 7.4 | | Data Analysis | | | |
|-----------|---|---|---|---|--|--|--|
| 4. | Correlation | | | | | | |
| | Correlation tells us the relation between 2 items. It always lies between -1 to +1 | | | | | | |
| | Strong | Weak V | Veak | Strong | | | |
| | -1.0 -(| 0.5 O | +0.5 | +1.0 | | | |
| | Negative C | Correlation | Positive Corre | elation | | | |
| | Army vs Terroríst Wherever army goes Terrorists are killed! Perfect -ve correl (-1) Rela plays There terrorist terrorist terrorists terrorists terrorists terrorists terrorist terrorists terrorist terrorist | tíon b/w Number of ed & Number of Ted e is no relation b/w ease in cricket math redict teddy bear s e, No correlation (c | Crícket matches dy bears sold v the 2. An his cannot be used ales! correl = 0) | Relation b/w Mother & Ch Wherever mother goes Child follows! Perfect +ve correl (+1) | | | |
| II) | CORRELATION FORMULA | | | | | | |
| • | Correlation _(x,y) = <u>Covariance_(x,y)</u> | | | | | | |
| | σ× σy | | | | | | |
| | Find the correlation between X & Y, if: Co | variance _(x,y) = 3600, | σx = 150, σy = 60 | | | | |
| Ex: | Correlation(x,y) = <u>3600</u> = 0.4 or 40% | | | | | | |
| Ex: A: | $Correlation_{(x,y)} = 3600 = 0.4 \text{ or } 40\%$ | | | | | | |

Data Analysis

| III) | CORRELATION INTERPRETATION | | | | | | | |
|------|--|--|--|--|--|--|--|--|
| | Correlation tells us about 2 things: | | | | | | | |
| | NATURE OF RELATION (Positive or ne | egative) | | | | | | |
| | STRENGTH OF RELATION (ex: 1 = very | strong relation, 0 = no relation etc.) | | | | | | |
| | | | | | | | | |
| | Scenario | Graph | Expected correlation | | | | | |
| 1. | Number of Cows I have & Quantity of milk I get every day. | • | Close to +1. Milk quantity is directly proportional to number of cows. | | | | | |
| 2. | Number of seeds sown & the number of new plants. | • | Close to +1. The more seeds I sow, the more plants will grow. | | | | | |
| 3. | Number of cars in a city Vs the air quality (cleanliness) of that city. | •••• | Close to -1. More cars = More pollution = decrease in air quality. | | | | | |
| Ч. | Time spent on social media vs 'real' happiness | | Clearly a -ve relation. But it is not perfectly -ve relation. It may be close to -0.5. | | | | | |
| 5. | Number of marriages in a year vs Number of Gold medal won in Olympics. | | Expected correlation = 0. Clearly, there isn't any relation b/w the two. | | | | | |
| 6. | Number of new mobiles sold vs New Facebook app installs | | Close to +0.5. (The dots are loosely scattered around the line.) | | | | | |

| 7 | | 6 |
|---|---|---|
| | ٠ | υ |

| 5. | Covariance | | | | | | |
|------|--|--|--|--|--|--|--|
| | Covariance calculation is quite similar to that of variance. | | | | | | |
| | Covariance has no range. It can range from - ∞ to + ∞ . (Unlike correlation which is always b/w -1 to 1) | | | | | | |
| - | Hence, covariance cannot tell about the strength of relation but only the nature of relation. (+ve / -ve). | | | | | | |
| | | | | | | | |
| I) | FORMULAS (similar to Variance) | | | | | | |
| | Variance = $\sum (x - \bar{x})^2$ Or $\sum P(x - \bar{x})^2$ | | | | | | |
| | N | | | | | | |
| | Covariance = $\sum (x - \overline{x})(y - \overline{y})$ or $\sum P(x - \overline{x})(y - \overline{y})$ | | | | | | |
| | N | | | | | | |
| | | | | | | | |
| Or | Covariance = Correlation $A_{AB} \times \sigma_A \times \sigma_B$ | | | | | | |
| | | | | | | | |
| -> | Refer Ques 2 and 3 from Simplified AFM Ques book for practice. | | | | | | |
| | | | | | | | |
| 1117 | COVARIANCE OF AN ITEFT WITH ITSELF = VARIANCE | | | | | | |
| | $COVARIANCE = \sum (x-x)(y-y)$ | | | | | | |
| | N | | | | | | |
| | In case of some security: | | | | | | |
| | Covariance = $\sum (x - \bar{x})(x - \bar{x}) = \sum (x - \bar{x})^2$ i.e. variance of the security | | | | | | |
| | N N | | | | | | |
| | | | | | | | |
| IV) | CORRELATION OF AN ITEM WITH ITSELF = +1 | | | | | | |
| | Correlation(a,a) = <u>Covariance(a,a)</u> | | | | | | |
| | σα σα | | | | | | |
| | | | | | | | |
| | Correlation (a,a) = <u>Variance(a)</u> = +1 | | | | | | |
| | Variance(a) | | | | | | |

Section 2 - A Genuine case of a Wheat Farmer!

A wheat farmer will be harvesting 100 Kg wheat after 3 months. However, he is afraid that the price of Wheat may fall by that time.

Currently the prevailing price is ₹15 per Kg. Any FALL in wheat price will directly impact the income of this farmer.

A wheat mill purchases wheat from farmers to make bread & cakes.

The Miller is afraid that the wheat price may INCREASE in the coming months. This will directly affect the profitability of his mill.

|) | SOLUTION = Futures contract |
|-----|--|
| | In this case, the wheat farmer and the Mill owner can enter into a contract to trade 100 Kg wheat after |
| | 3 months at a PRE-DETERMINED RATE. Let us say that the price is fixed today at ₹16/kg. |
| | THIS IS KNOWN AS A FUTURES CONTRACT. |
| | Wheat Farmer -> Will supply 100 Kg wheat, after 3 months at the pre-fixed rate of ₹16/kg. |
| | Mill owner -> Will purchase 100 Kg wheat, after 3 months at the pre-fixed rate of ₹16/kg. |
| | |
| I) | IMPORTANT POINTS! |
| | The contract is entered today only. The rate at which wheat will be delivered is also fixed today only. |
| | Even the quantity of wheat is also fixed today. |
| - | Only the delivery of the wheat by Farmer and the payment by Miller will be made at a future date. |
| | |
|) | WHO IS LONG, WHO IS SHORT? |
| - | Wheat farmer will Sell wheat in future -> He has sold futures contract. i.e. he has SHORT position. |
| - | The Miller will Buy wheat in future -> He has bought futures contract. i.e. he has LONG position. |
| | |
| 1V) | VERY EASY WAY TO DETERMINE POSITION |
| | If you want to buy in future -> Buy futures contract i.e. Long futures (F+) |
| | If you want to sell in future -> Sell futures contract i.e. Short futures (F ⁻) |
| v) | BASIC TERMINOLOGY OF FUTURES CONTRACT |
| 1. | The quantity decided of 100kg is known as 'Lot size of futures contract.' |
| 2. | The period of 3 months is known as 'Expiry of futures contract' |
| 3. | The price that is fixed today (of ₹16/kg) is known as the 'price of futures contract' |
| | |
| VI) | CRUX |
| | THE ABOVE ILLUSTRATION IS OF - PHYSICAL DELIVERY FUTURES CONTRACT. |
| - | Technically speaking, the above case is of 'Forward' (more detail later). |
| | |
| | |
| | |
| | |
| | |
| | |
| | |

8.4

Section 3 - Airlines are worried!

Problem — Gogo Airlines is worried about an increase in oil prices (as it means higher operational costs). It will need 1 Lakh barrels of oil after 2 months.

At the same time, oil producers are concerned about a fall in oil price (as it means lower revenue).

The current oil price is \$75/barrel. 2-months oil futures are trading at \$74/barrel.

| I) | SOLUTION | | | |
|-------|-----------------------------|--------------------------------|------------------------|-----------------------------------|
| | Enter into a 2-month ful | tures contract for 1 lakh ba | rrel at a rate of say | \$74 per barrel. |
| | Gogo airlines -> Wants | to buy oil in future -> Buy | futures (i.e. Long fu | itures) |
| | Oil company -> Wants | to sell oil in future -> Sell | futures (i.e. Short fu | tures) |
| | | | | |
| II) | SETTLEMENT UNDER NE | ET SETTLEMENT | | |
| | Under this only profit / l | oss is net settled. | | |
| | Price on expiry i.e. after | 2m Profit / loss to , | Airline co. Pr | rofit / loss to oil co. |
| | 80 | 6 x 1 lakh = \$6,00 |),000 -6 | 6 x 1 lakh = - \$ 6,00,000 |
| | 65 | -9 × 1 lakh = -\$9, | 00,000 9 | x 1 lakh = \$9,00,000 |
| III) | SETTLEMENT UNDER PH | IYSICAL DELIVERY | | |
| | Under this Gogo Itd will p | ourchase Oil at \$74/barrel fr | om the oil co. irresp | pective of the prevailing price. |
| | Market Price on | Price at which Gogo ltd. | Profit / (loss) | Profit / (loss) |
| | expiry (after 2m) | will buy & oil co. will sell | to Gogo ltd. | to Oil co. |
| | 80 | \$74 / barrel | (80 - 74) × 1L = \$ | 6L (74 — 80) × 1L= - \$ 6L |
| | 65 | \$ 74 / barrel | (65 — 74) × 1L = - | \$9L (74 - 65) × 1L = \$9L |
| IV) | CRUX - BOTH ARE SAM | E | | |
| | Clearly, it can be seen fro | om above that both the me | thods essentially lead | d to same financial outcome. |
| Note: | We have assumed that o | il price after 2 months turr | ns out to be: Case 1 | - \$ 80 / barrel |
| | | | Case 2 | \$65 / barrel |
| | You can take any other o | assumption Net conclusion | will remain some | φουν τουτοί |

Derivatives (Futures)

Section 3 (1) - Smart Boy can Profit from Apples!

(Theory of No Arbitrage)

| III) | I) WHAT IS ARBITRAGE? | |
|------|--|--------------------|
| | The ₹20 earned in above ex is called arbitrage profit. Arbitrage profit generally has 3 ch | aracteristics -: |
| a) | a) No risk b) Sure shot profit | |
| c) | c) No initial outlay of funds i.e. में अपनी जेब से पैसा नहीं खर्चूंगा ! | |
| | | |
| IV) | /) PRINCIPAL OF NO ARBITRAGE (PNA) or LAW OF ONE PRICE | |
| | In real life, you will hardly observe any arbitrage opportunities. This is because the actic | ons of arbitragers |
| | themselves vanishes such opportunities and brings price to where it should be. | |
| | For ex: i) Apple price in Gurgaon & Delhi became equal | |
| | ii) Infosys price on BSE & NSE became equal | |
| | This is known as 'PRINCIPAL OF NO ARBITRAGE (PNA)' . | |
| | This is also known as 'Law of one price'. i.e. 2 securities or portfolios that have identic | al cash flows in |
| | the future, regardless of future events, should have the same price. | |
| V) | /) ARBITRAGE USING BOND STRIPS | |
| | We read in 'Bonds' that: Value of Interest strip + Value of Principal strip = Value of Bo | ond |
| Ex: | x: If the current market yield is 9%. Then price of a 3-year, 9% bond = 1,0 | 000 |
| | Price of interest only strip (IO strip) = 227.82. Price of Principal only strip (PO strip) | = 772.18 |
| | i.e. Bond price = 10 strip + PO strip → 1000 = 227.82 + 772.18 | |
| Q: | Q: Construct arbitrage if bond is trading at 1005 and IO strip = 225 & PO strip = 770. | |
| | Arbitrage -> Sell the bond and Buy IO strip + PO strip | |
| | Arbitrage profit = 1005 - (225 + 770) = ₹10 | |
| | Why is this arbitrage profit? | |
| a) | a) Sure shot profit of ₹10 | |
| b) | b) Since it includes simultaneous buying and selling of the bond and its strips, there is no r | isk and also no |
| | funds are required to be invested. | |
| | BUT SOON IO & PO \rightarrow Huge buying pressure due to increase in demand \rightarrow Pri | ce will increase |
| | Bond $ ightarrow$ Huge selling pressure will lead to increased supply $ ightarrow$ Price | will fall. |
| | This will continue till → Price of Bond = Price of IO + PO strip | |

|---------|----------------------|--|----------|--|---------------------|
| | | Diwali TIME OPEN | vali | Lottery, | |
| | | THIS DIWALI - LET'S | BUY A | FINANCIAL LOTTERY | |
| | A conversion betwe | een Lottery uncle Mr. Yadav ar | nd a pro | ofessional finance student. | |
| | Mr Yaday: Regular lo | to purchase a lottery. Otteries are now bugone. Whu | don't i | Jou tru new age 'Financial lot: | eries ' |
| | We have 2 types of | `financial lotteries | | | |
| | Type 1 - चढ़ने पर म | गलामाल Lottery | | | |
| | Type 2 - गिरने पर म | मालामाल Lottery | | | |
| | | | | | |
| I) | 1-MONTH चढ़ने प | र मालामाल LOTTERY | | | |
| 1) | First you decide a s | tock & and strike price. Say yo | ou decia | led TVS stock and strike price c | of ₹500. |
| 2) | You buy this lotter | y by paying the lottery ticket | price (a | ilso known as lottery premium |). Ticket price for |
| | TVS stock at a strik | e price of ₹500 is ₹25. | | | |
| 3) | keward on expiry - | Tou will gain if price on expire | Jexcee | as the strike price of 2500. | |
| | | चढ़न पर म | แตเห | | |
| | | If Stock Price on expiry > Strike price | | If Stock Price on expiry ≤ Strike price | |
| | | Wohooo 😂 Lottery Nikal gai. | | Lottery Fusssss 😭 But no tension | |
| | | Gain = Stock price - Strike price | | Kuch Dena nhi h So, Payoff = '0' 🙂 | |
| | | Ex: If Stock Price on expiry = ₹540, then Gain = 40 (i.e. 540 - 500) | | Ex: If Stock Price on expiry = ₹470, then Payoff = 0 | |

| II) | 1-МОНТН गिरने प | पर मालामाल LOTTERY | |
|------|-----------------------|--|---|
| | Almost same as च | ढ़िने पर मालामाल Lottery but he | ere you'll gain if price on expiry falls below strike price. |
| | | गरिने पर मार | लामाल LOTTERY |
| | | If Stock Price on expiry ≥ Strike price | If Stock Price on expiry < Strike price |
| | | Fussss 😪 But its ok. Because | You won😁 Lottery Nikal padi |
| | | Kuch Dena nhi h So, Payoff = '0' 🙂 | Payoff = Strike Price - Stock price |
| | | Ex: If Stock Price on expiry = ₹540, then | Ex: If Stock Price on expiry = ₹470, then |
| | | Payoff = 0 | Payoff = 30 (500 - 470) |
| III) | NET PROFIT = Par | yoff - Option Premium Paid | |
| | Ex: You won ₹40 f | rom the lottery. But you earlier | paid ₹25 as lottery ticket price. |
| | Then your Net pro | fit = ₹15 only (40 - 25). | |
| | Technical Learnin | as from Above Story | |
| 1 | These financial lot | teries are called 'options'. | |
| | चढ्ने पर मालामाल | T Lottery is called call options. | |
| | गिरने पर मालामाल | T Lottery is called put option. | |
| 2. | Ticket price is paid | at the time of purchasing the o | ption. This is known as option premium (OP). |
| | Once paid, this opt | ion premium is non-refundable. | |
| 3. | 'Strike price' is use | ed to calculate reward of winner. | . Strike price is denoted by denoted by k. |
| • | Call option buyer v | vill win if Stock price on expiry (St |) is more than the strike price (k) i.e. betting on upside. |
| • | Put option buyer v | vill win if stock price on expiry (ST) |) is less than the strike price (k) i.e. betting on downside. |
| Ч. | The period of opti | on is known as expiry period. This | is denoted by 't'. |
| 5. | Winning lottery is | also called exercising the option. | |

PARTA: Setting the base!

Let us discuss a very (very) basic Graph \rightarrow Line Graph!

A student named 'Happy' has following track record in terms of class discipline. Ex: 5 y-axis: Number of instances Late in class Number of 4 (in minutes) instances 3 2 1 2 4 3 1 6 4 0 0 1 2 3 4 5 9 6 8 2 x-axis: Late in minutes or, the above question may be framed in the terms of probability instead of absolute instance: Late in class Number of Probability 40% (in minutes) instances

y-axis: PROBABILITY 30% 2 1 10% 20% 4 3 30% 10% 6 4 40% 8 2 20% 0% 0 1 2 5 7 3 4 6 8 9 Total 10 100% y-avis: Late in minutes

| TOtal. | 10 | 100 % | A-dAIS. Late III IIIIIutes |
|-----------------------------|-----------------|-----------------------|---|
| | | | |
| DID YOU C | DBSERVE? | | |
| The shape | of the graph | in both the cases r | emains absolutely same. The only difference is that in case of: |
| 1 st Graph - | -> Y-axis conto | ains figures in absol | ute terms. |
| 2 nd Graph - | -> Y-axis conta | ains figures in term | s of probability. |
| | | Ĩ | |
| Importa | nt When | ı y-axis contain | ns figures in terms of probability -> |
| Then su | ch line Gra | ph is known as | 'Probability Distribution.' |

|---|-----------|--------|-------|-----------|---------|
|---|-----------|--------|-------|-----------|---------|

| i) | How many people have height less than 5.7" i.e. the mean h | neight? Or find probability of height < 5.7". | | | | |
|------|--|---|--|--|--|--|
| A: | In case of ND, 50% of items are less than the mean value. | | | | | |
| | \therefore Number of people with height < 5.7" = 50,000 × 50% = = | 25,000 | | | | |
| | Prob(Height < 5.7") = 25000/50000 = 50% | | | | | |
| ii) | What is the probability that a randomly selected person w | vill have height > 6.5%? | | | | |
| iii | Probability = 5% (given in gues) | | | | | |
| / \. | | | | | | |
| iii) | What is the probability that a randomly selected person will have height < 6.5"? | | | | | |
| A: | Prob. (Height < 6.5") = 100% - 5% = 95% | | | | | |
| iv) | Probability that a randomly selected person will have heigh | nt > 4.9". | | | | |
| A: | Only 5% people have height < 4.9". | | | | | |
| | Prob. (Height < 6.5") = 100% - 5% = 95% | | | | | |
| v) | If 30% of people have height between 5.7" — 6.2", then w | hat is the probability that a randomly selected | | | | |
| / | person will have height less than 6.2"? | <u>↑</u> | | | | |
| A: | We know that in case of ND, 50% of items lies below | A | | | | |
| | mean. Hence, 50% people will have height < 5.7". | 50% people have | | | | |
| | | Height < Mean and 6.2" | | | | |
| | Also, we are given that 30% of people have height | | | | | |
| | between 5.7" & 6.2". | | | | | |
| | ∴ Total people with height < 6.2" = 50% + 30% = 80%. | | | | | |
| | | 5.7" 6.2" | | | | |
| vi) | If 37.5% people have height between 5.0" and 5.7", ↑ | | | | | |
| | then what is the probability of: | 37.5% people have | | | | |
| | - Prob. (Height > 5.0") - Prob. (Height < 5.0") | height between 5.0" | | | | |
| Ans: | Prob.(Height > 5.0") = 37.5% + 50% | | | | | |
| | = 87.5% | TA | | | | |
| | | → 50% people have | | | | |
| | Prob.(Height < 5.0") = 100% - 87.5% = 12.5% | ileigiit > Mean | | | | |
| | or = 50% - 37.5% = 12.5% | Maan E 7" | | | | |
| | Balanče 12.5% Mean=5./ people have height | | | | | |
| | | less than 5.0" | | | | |
| | | | | | | |

PART C: Introduction To Z-scores

| 1. | Introduction to Z-scores | | | | |
|------|---|---------------------------------------|--|--|--|
| Ex: | : Let us say that mean weight of an adult is 70 Kg, with a SD of 10 Kg. Weight data follows ND. | | | | |
| • | Mr. Fluffy weights 90 Kg. We can say that: | | | | |
| | Mr. Fluffy has 20 Kg (90-70) more weight than an average person (70 Kg). | | | | |
| | Or | | | | |
| | Fluffy's weight is 2 SD higher from the mean weight. i.e. (90-70)/10 = +2 | | | | |
| | When distance is defined in terms of SD, then it is known as Z-score. | | | | |
| | Z-SCORE = <u>X - MEAN</u> | (Don't cram the formula. Its v.ea | | | |
| | SD | | | | |
| Ex: | If mean weight = 70 Kg & SD = 10 Kg, Find the z-s | core in the following cases: | | | |
| i) | Weight of Mr. Chubby = 85 Kg | | | | |
| | Z-score = <u>X - Mean</u> = <u>85 - 70</u> = 1.5 | | | | |
| | SD 10 | | | | |
| ii) | Weight of Mrs. Zero figure = 45 Kg | | | | |
| | Z-score = <u>X - Mean</u> = <u>45 - 70</u> = -2.5 | | | | |
| | SD 10 | | | | |
| iii) | Weight of Mr. Adequate = 70 Kg | | | | |
| | Z-score = <u>X - Mean</u> = <u>70 - 70</u> = 0 | | | | |
| | SD 10 | | | | |
| | | \square | | | |
| | | | | | |
| 2. | NEGATIVE & POSITIVE Z-SCORES | | | | |
| | Positive Z-score = Item is above mean. | | | | |
| | Negative Z-score = Item is below mean. | | | | |
| | Zero Z-score = Item = mean. | | | | |
| | | Nagativa 7 Saaraa 0 Daaitiva 7 Saaraa | | | |

Getting Friends with ND

| ••• | Why do we even need Z-scores? Because the rules of normal distribution are very precise. If something truly follows a Normal distribution | | | | | | |
|-------------|--|--|--|---|--|---|--|
| | | | | | | | |
| | then the distance between mean & SD conveys the probability of an item. | | | | | | |
| | | | | | | | |
| Illus: - | If mean weight = 75 Kg & SD = 20, then: | | | | | | |
| | If we move 1.645 SD away from mean, we will cover 95% of the population. | | | | | | |
| | i.e. 1.645 × 20 = 32.9 Kg away from mean. | | | | | | |
| | i.e. 75 + 32.9 = 107.9 Kg | | | | | | |
| | \therefore we can confidently say 95% of population have weight \leq 107.9 Kg. | | | | | | |
| | If we move 1.96 SD higher from mean, then we will cover 97.5% of all the population. | | | | | | |
| | i.e. 75 + 1.96 × 20 | = 114.2 Kg | | | | | |
| | ∴ we can confi | dently say 97.5% of | population hav | e weight \leq 114.2 Kg. | | | |
| | Or, FORMULA WISE | | | | | | |
| | To cover a certain probability, we need the z-score corresponding to it. | | | | | | |
| | Then formula = Mean + Z.SD | | | | | | |
| | | | | | | | |
| | | · ··· · | | | | | |

| 5. | Applications using Z-scores | | | | | |
| | The following scenarios assumes Noi | mal distribution. | | | | |
| | | | | | | |
| Case 1: | Strong ltd, a construction co. wants to design the door height for the flats. According to a survey, | | | | | |
| | the average height is 160 cm and SD = 15 cm. Find the appropriate door height such that at least 95% of | | | | | |
| | people can easily pass through. | | ↑ | | | |
| Ans: | I know, if I move 1.645 SD away fro | m mean, | \square | | | |
| | then I will cover 95% of population | | | | | |
| | | | | | | |
| | Therefore, relevant Z-score for 95% | prob. = 1.645. | | | | |
| | | | | | | |
| | Required door height = Mean + Z.SD | | | | | |
| | = 160 + 1.645 × | 15 | | , | | |
| | = 184.675 cm | | 160 18 | 84.675 | | |
| | | | 1.645 SI |)' | | |
| | | | | | | |
| | | | | | | |
| Case 2: | Mr. Smart started a new printing bu | siness. The average in | iitial required capital would be ₹10 | lakh. However, | | |
| | this amount can vary and have a st | andard deviation of a | ₹60,000. Mr. Smart wants to be 99 | % sure that | | |
| | there is no shortage of funds. How | much money should | he keep aside? | | | |
| Ans: | Z-score for 99% probability = 2.33 | | | | | |
| | | | , A | | | |
| | \therefore Required funds = Mean + z.SD | | | | | |
| | = 10,00,000 + 2.33 | × 60,000 | A | | | |
| | = ₹11,39,800 | | | | | |
| | | | | | | |
| | i.e. we are 99% confident that the | und requirement | | | | |
| | of the company will not exceed ₹11 | ,39,800. | | | | |
| | Hence, -> Max required funds at 99% | , confidence | | \rightarrow | | |
| | level is ₹11,39,800. | | 10L 11 | 1.398L | | |
| | | | 2.33 SD | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |

| Case 3: | Mr. Daring started a new start-up co. The expected next year profits of the company is ₹5 Lakh with a | | | | |
|---------|--|--|--|--|--|
| | standard deviation of ₹3,50,000. Mr. Daring wants to know the maximum loss that the company may incur | | | | |
| | at 99% confidence level. | | | | |
| Ans: | Z-score for 99% probability = 2.33 | | | | |
| | ∴ Max. loss = Mean - z.SD | | | | |
| | = 5L - 2.33×3.5L | | | | |
| | = -3.155 Lakh | | | | |
| | | | | | |
| | Hence, we can be 99% confident that the | | | | |
| | max. loss that will be incurred by the co. in -3.155L 5L | | | | |
| | one-year time frame will be ₹3.155 lakhs. | | | | |
| | | | | | |
| | This Maximum Loss is known as Value at Risk (VaR) | | | | |
| | | | | | |
| Case 4: | A stock has a mean of 10% and a standard deviation of 12%. Find the max. loss that may be incurred on | | | | |
| | this stock at 95% confidence level. Or in other words, find the Value at Risk (VaR) at 95% confidence level. | | | | |
| Ans: | Z-score for 95% probability = 1.645 | | | | |
| | \square | | | | |
| | ∴ 95% VaR = Mean - z.SD | | | | |
| | (or Max. loss at = 10% - 1.645×12% | | | | |
| | 95% confidence) = -9.74% | | | | |
| | | | | | |
| | Hence, we can be 95% confident that the max. | | | | |
| | loss that may be incurred is 9.74%. | | | | |
| | -7.14% IU% | | | | |
| | 1.645 SD | | | | |
| | | | | | |
| | | | | | |
| | | | | | |
| | | | | | |
| | | | | | |
| | | | | | |
