100% Practical Coverage

The syllabus of the syllabus o

- ✓ Simplified Notes Concepts In, Stress Out :)
- Relevant examples for better understanding
- ✓ 100% COMPATIBLE with Simplified SFM Ques Bank
- Completely exam oriented
- Compact Perfect for last day revision

Finance Acharya Jatin Nagpal (CA, FRM)

A Big thanks to ...

The Almighty – I bow down to your gentle feet. Nothing can be achieved without your ultimate blessing.

My Parents & Elder brother - Whose continuous support & efforts made this book possible.

My Teachers and guides – The one who enlightens the path and make us capable of walking on that path.

Team Krivi – Everyone for your relentless efforts.

And yes.... TO YOU ALL STUDENTS – For showering us with your love, faith and support.

Every effort has been taken to avoid any error or omission in this book. However, if you still find any error or omission then please share it at any of the following-

Whatsapp or Telegram us at 94784-23144. or Email us at <u>hello.krivii@gmail.com</u>

The author or the publisher shall not be responsible for any kind of damage or loss due to error or omission.

Update About AFM "Additions"

A few topics have been added in AFM such as: - Advanced Capital Budgeting

- Real options, Credit derivatives

- Some topics in Corporate Valuation etc.

A small booklet containing these additions will be provided soon. (These Additions only account 5-10% of your AFM Syllabus. Please cover the rest of the subject till we provide these additions)

HOW TO READ THIS BOOK?

This book has Active cross-referencing with Simplified AFM Ques book.

Relevant ques number from Simplified AFM Ques book is mentioned at the right side of the topic.

Ex: Breaking down Total risk (TR) into SR & USR

(19, 28, 29, 30, 31)

First read the concept from this concept book and then practice these ques from Simplified Ques book.

2. This book contains AFM Practical Concepts.

For Theory -> Download our Simplified AFM Theory book.

Simplified AFM Theory book can be downloaded for FREE from our Telegram channel.

For best results, follow Simplified AFM Ques Bank for Ques.
 It can be downloaded for FREE from our Telegram Channel 'Krivii Eduspace - Jatin Nagpal (CA, FRM)'
 It is the only AFM book that contains simplified solutions of every ques.

4. Found a mistake, error or omission?

Whatsapp / Telegram us at 9478423144

or mail us at <u>hello.krivii@gmail.com</u>

5.Unable to understand a concept or feel uneasy while solving questions?AFM Saviour batch - A batch where we conceptually cover entire AFM in just 65 hours.

For more details visit <u>www.krivii.in</u> or contact us at 9478423144 (WhatsApp / Telegram)

Chapter 2
Risk Management
Chapter Index
Part A – Understanding ∉ Calculating VAR Part B – Risk VS Exposure
Student's Space for Summary chart and notes

Finance Acharya Jatin Nagpal (CA, FRM)	2.2
--	-----

PART A: Understanding & calculating VAR

1.	Calculating risk using VAR (Value at Risk)		
I)	INTERPRETATION OF VAR		
Illus:	95% 1-day VAR = ₹8 lacs. This means that		
i)	In 95% scenarios, the maximum loss that one would incur in a day = ₹8 lacs		
ii)	In 5% of the worst scenarios, the minimum loss that would be incurred in a day = ₹8 lacs		
	In worst 5% scenarios, loss will exceed Rs.8 Lacs Or in worst 5% Scenarios, min. loss will be Rs.8 Lacs. B Lacs 8 Lacs		
II)	CALCULATION OF VAR		
	In 'Pre-Chapter — Getting friends with ND' we derived that:		
	VAR = $\mu - z.SD$ (where μ = mean return		
	prmula remains same, with one major change -> Here we assume that μ = 0		
	The above formula becomes:> VAR = z.SD		
III)	VAR HAS 2 DIMENSIONS:		
a.	Confidence level — Are we calculating risk (VAR) at 95% confidence level, 97.5% or 99% etc.		
þ.	Time period — Are we calculating risk (VAR) for 1-day, 10-days or a year.		
IV)	CONFIDENCE LEVEL (CL) or Z-SCORE		
	z-score is calculated from normal distribution corresponding to confidence level at which VAR is calculate		
	· •		

2.3

WWW.KRIVII.IN

	Confidence level ->	90 %	95 %	97.5 %	99 %	99.9 %	
	Z - score ->	1.28	1.65	1.96	2.33	3.09	
V)	TIME PERIOD					(1,2,3	
	Variance is proportional to time. \therefore SD is proportional to square root of time.						
	Hence, this implies that 'VAR IS ALSO PROPORTIONAL TO SQUARE ROOT OF TIME'.						
	If 1-day VAR = 6.2%,	then	→ 10-da	ays VAR = 1-day VA	R x √t = 6.2% x ~	√10 = 19.606 %	
Ex 1:	10-days variance = 225	5. ∴10-day SD	= √225 = 15				
i.	Calculate 1-day varian	ce.					
ii.	Calculate 1-day stando	ard deviation.					
Ans: i)	225/10 = 22.5						
ii)	1 st method \rightarrow 1	-day SD = Sq. r	oot of 1-day v	ariance = √22.5 = 4	.74%		
	2^{nd} method $\rightarrow 1$	-day SD = 10 d	ays SD / √time	= 15 / \sqrt{10} = 4.74 %	/ 0		
	Hence, Standard is pro	portional to s	square root of	time.			
Ex 2:	1-year SD = 34%. Find	1-day & 10-day	15 95% VAR. Ass	sume 252 trading d	lays in a year.		
Ans:	$1-day SD = 34\%/\sqrt{252} = 2.14\%$						
	1-day 95% VAR = z.SD = 1.645 × 2.14% = 3.5236%						
	10-days SD = 34% × √10/252 = 6.77%						
	10-days 95% VAR = 1.645 × 6.77% = 11.14%						
Or	Directly, 10-days 95%	VAR = 1-day 95	5% VAR × √10 =	= 11.14% (approx.)			
2.	Some notes o	<mark>n VAR</mark>					
I)	RELATIVE VAR VS A	BSOLUTE VAR	2				
	VAR can be expressed	in: %	ightarrow Relativ	ve VAR			
		Amo	unt 子 Absoli	ute VAR			
Ex:	James invested ₹1 cro	ore in stock m	arket. 1-day 959	% VAR of his porti	Olio = 6.4%		
	Relative VAR = 6.4%						
	Absolute VAR = 1 cro	re x 6.4 % = ₹ 6	540,000				

Finance Acharya Jatin Nagpal (CA, FRM)

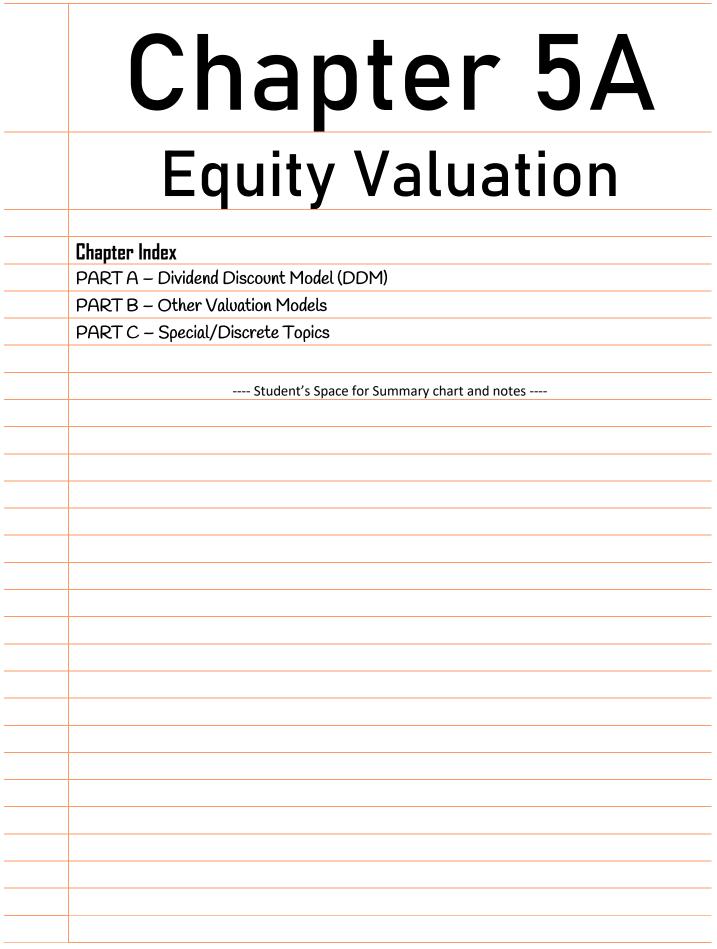

2.4

II)	NUMBER OF DAYS						
	If nothing is mentioned in question, then assume 252 TRADING DAYS IN A YEAR. Also, 1-week = 5 days. And 2-weeks = 10 days (as Sat & Sun are trading holidays).						
III)	CONFIDENCE LEVEL (CL) VS SIGNIFICANCE LEVEL (SL)						
	Significance level = 100 - confidence level A 90% confidence level means significance level = 10%.						
	Confidence Level -> 90% 95% 97.5% 99% 99.9%						
	Significance level -> 10% 5% 2.5% 1% 0.1%						
	Z-Score -> 1.28 1.65 1.96 2.33 3.09						
IMP!	! When VAR is denoted as VAR(1%), VAR(5%) etc. then this 1% or 5% etc. represents significance level alv	Nai					
	(As no one is interested in calculating VAR at such a low confidence level.)						
3.	. PORTFOLIO VAR (4,5,	۲)					
5.		57					
I)	SD IN VAR FORMULA (σ)						
	SD in above formula = SD of the asset whose risk is calculated. When we calculate risk of:						
	- stock/foreign currency/bond etc. = Take SD of that stock/foreign currency/bond respectively						
	- Portfolio = Take SD of that portfolio						
II)	PORTFOLIO VAR: Method 1						
	Portfolio VAR = z.SD						
	where SD = SD of the portfolio.						
	Recall portfolio Varinace formula $\rightarrow \sigma_P^2 = (w_a \sigma_a)^2 + (\omega_b \sigma_b)^2 + 2\omega_a \omega_b (\sigma_a \sigma_b r_{a,b})$						
III)	PORTFOLIO VAR: Method 2						
	Direct calculation						
	$VAR_{p^2} = (VAR_a)^2 + (VAR_b)^2 + 2VAR_a VAR_b(r_{a,b})$						
	NOTE! — Take absolute VAR (i.e. VAR in amount) in above formula.						
IV)	RISK REDUCTION IN VAR DUE TO DIVERSIFICATION (or Benefit of diversification)						
	= Sum total of VAR of individual components — VAR of portfolio						
	= VAR _A + VAR _B - VAR _{Portfolio}						

PART B: Risk vs Exposure

Ans: Exposure = \$200,000 - \$150,000 = \$150,000

PART A: Dividend Discount Model (DDM)

IV)	SPECIAL NOTE - DIVIDENDS		
۲.	$\frac{1.15}{1.15} = \frac{1.15^2}{1.15^2}$		
Ex. A:	Value = (PVC1) = 5 + 7 + 200 = ₹141	WO YOURS - 2200. I IIN VUIDE LOUDY IF NE - 15 10.	
F	DPS ₁ = \gtrless 5. DPS ₂ = \gtrless 7. Expected sale price after t	·	
1117	-	lend + Sales proceeds. That will be the value of share.	
III)	PRICE AT THE END OF N TH YEAR IS GIVEN	(23a, 2	
	(1 + ke) (1 + Ke) ²	Ke — g (1 + Ke) ²	
	Value (in this case) = $DPS_1 + DPS_2 +$	DPS ₃ x 1	
Ex :	Growth rate is said 15% for first 2 years & the	n it stabilizes to 6% p.a.	
II)	CASE 2 - WHEN GROWTH RATE CHANGES - 2	STAGE DDM (8, 11, 12,	
	Ke — g		
	Value = DPS1	(i.e. PV of perpetual growth series)	
I)	CASE 1 - DIVIDENDS WILL GROW AT A CONST		
	(Gordon model is simply PV of future dividends. Su	per easy if you are comfortable with calculating PV)	
	So, Value = PV of Dividends		
	As per Gordon, if you invest in a share, then y		
1.	Gordon Model / Dividend Disc	ount Model (DDM) / Growth Model	
	CY = Current year	PY = Previous year	
	PV = Present Value	CMP = Current market price (also denoted by P_0 or	
	b = retention ratio	Ke = Required return on equity r = return on equity (also denoted by ROE)	
	g = growth rate		
	DPS = Dividend per share	EPS = Earning per share	

ity v	Valuation	5A.3WWW.KRIVII.I		
þ.	IF DPS ₁ IS NOT DIRECTLY GIVEN: $DPS_1 = D$	PS ₀ (1+g)		
	or DPS ₁ = El	^p S ₁ (1-b)		
C.	NEXT YEAR DIVIDEND OR D1 IS ALSO KNOWN	AS CURRENT YEAR DIVIDEND OR DO ARE ALSO KNOWN A		
	Dividend yet to be paid	Dividend paid		
	Dividend at the end of year 1	Last year dividend		
	Expected dividend	Dividend as on today		
d.	Dividend generally given in "Historical" Financial Statements (Balance Sheet, Income Statement) is DPS0.			
e.	Dividend rate % \rightarrow Calculated on Face-value.			
	Dividend yield % $ ightarrow$ Calculated on Market-Pr	ice.		
2.	Growth Rate	(2)		
		(2)		
	Growth rate = b*r	(b = retention ratio and r = return on equity		
Note:	Growth rate = b*r	(b = retention ratio and r = return on equity t imply? Dividend will grow at 12%? Or EPS will grow at 12%?		
	Growth rate = b*r If growth rate = 12% p.a. Then what does i	(b = retention ratio and r = return on equity t imply? Dividend will grow at 12%? Or EPS will grow at 12%?		
Note:	Growth rate = b*r If growth rate = 12% p.a. Then what does i Ans -> Both. (UNLESS DIVIDEND PAY-OUT RA	(b = retention ratio and r = return on equity t imply? Dividend will grow at 12%? Or EPS will grow at 12%? TIO IS CHANGING).

FIO IS CHANGING). (6) <u>EPSo</u> Ke atio (b) = 0 (as r cannot be 0). DPSo = DPS1 (9) -> Normal growth, No growth or Negative growth.		

ROE =

•

Earnings available for ESHs

ESH's Funds

IV)	WHEN G > KE	(4)				
	If long-term growth rate > Ke, then it not possible to calculate value via Gordon growth model.					
	In exam simply write $-$ ' g > ke, hence it is not possible to use Gordon growth model.'					
V)	CALCULATING G USING HISTORICAL DIVIDEND DAT	A (10)				
	Sometimes details related to growth rate is not directly given in ques, but historical DPS data is giver					
	In such cases, we can estimate CAGR (compounded o	annual GROWTH RATE) using historical DPS data.				
Ex:	Year 2018 2019 2020	2021 2022				
	DPS 15 17 20	22 24				
	Calculate growth rate from the given data.					
A:	$DPS_{2018} (1 + g)^{4} = DPS_{2022}$					
	$15(1 + g)^{4} = 24$ => g = 0.1246 or 12.46%					
3.	Return on Equity					
	ROE tells us how much the company is able to earn	for its equity shareholders.				
	ROE = Earnings available for Equity Shares					
	Equity Shares Funds (PUSC + R&S)					
Ex:	If shareholders invested ₹1000 in a company & the c	ompany generates an ROE of 18%.				
	This means that the co. was able to earn 1000x18% =	= ₹180 for its shareholders.				
	(Now this 180 may be paid to shareholders as dividen	d or maybe retained by the co.)				
II)	RETURN ON EQUITY (ROE) VS REQUIRED RETURN	1				
	Return on Equity	Required / expected return on equity				
•	This is what the MANAGEMENT of the company is	This is what the EQUITY SHAREHOLDERS of the co.				
	ABLE TO EARN on the equity shareholder's funds.	WANT TO EARN on their investment in the company.				
•	Used to estimate the future earnings of the co.	This is used as a discount rate to calculate the				
	& in estimating the growth rate of the company.	VALUE that the investors will be willing to pay.				

There are several ways to calculate the Required

rate on equity such as CAPM etc.

5A.4

Equity Valuation

4.	Dividend policy					
	Let us say company has ₹100 as retained earnings. ESHs' require 15% return on this i.e. Ke = 15%.					
	If co. is can earn more than 15%, then retain entire ₹100 and invest it itself. If co. can earn < 15% (i.e. ROE < 15%) then its better to distribute it & let SHs' invest themselves.					
		Optimum	Optimum			
	Scenario Preference	Dividend	Retention			
1.	If ROE > Ke Co. should invest (as it can earn better)	0%	100%			
2.	If ROE < Ke SHs shall invest themselves (Co. pay dividends)	100%	0%			
3.	If ROE = Ke Indifference point	Any (0-100%)	Any (0-100%)			
5.	Cost of equity (Ke)					
I)	AS PER CAPM					
	Ke = $R_F + (R_M - R_F) \times Beta$	(more detail in P	ortfolio Chapter)			
II)	USING EXISTING MARKET PRICE TO CALCULATE KE					
	$P_0 = DPS_1 / (Ke - g)$					
	Simply put all the values in the above equation & calculate Ke.					
Ex:	CMP of Kadak ltd. is ₹150. It paid a dividend per share of ₹12. Find K	e if growth rate of 1	che co. is 6%.			
A:	$Value = DPS_0 (1 + g)$					
	Ke = g					
	150 = <u>12 × 1.06</u> => Ke _ 0.06 = <u>12.72</u> => Ke	= 0.1448 or 14.48%				
	Ke — 0.06 150					
IMP!	IMP! Why are we not solving Ke using direct formula (i.e. Ke = DPS1/Po + g)?					
	<u>Reason</u> : Above formula works only if the ques is straight-forward.	But fails miserably if	ques is twisted.			
Ex :	Calculate Ke if CMP = ₹50. DPS1 = ₹2. DPS2 = ₹4. Dividend will grow a	t 6% p.a. after that.				
Ans:	Step 1: Write the Equation					
	Value = $\underline{DPS_1} + \underline{DPS_2} + \underline{DPS_3} \times \underline{1}$					
	1+Ke (1+Ke) ² Ke – g (1+Ke) ²					

	Acharya Jatin Nagpal (CA, FRM) 5A.6 Equity Valuatio				
-	$50 = 2 + 4 + 4 \times 1.06 \times 1$				
	1+Ke (1+Ke) ² Ke – 0.06 (1+Ke) ²				
	Step 2: Solve Ke using Hit & trial. Just like IRR				
	Let Ke = 15% Value = 2 + 4 + 4 × 1.06 × 1 = ₹40.39				
	Value = $2 + 4 + 4 \times 1.06 \times 1 = ₹40.39$ 1.15 1.15 ² 0.15 - 0.06 1.15 ²				
	Similarly, Value if Ke is 12% = ₹58.20				
	IRR = Lower% + <u>(Change in %)</u> × (Required Value — Value @ Lower%)				
	(Change in value)				
	IRR = 12% + (3%) × (50 - 58.20) = 13.38%				
	(40.39 — 58.20)				
	Hence, cost of equity (Ke) = 13.38%				
Ex:	DPS ₁ = ₹5. DPS ₂ = ₹7.				
	We expect to sell shares at the end of 2 nd year for ₹200. Calculate Ke if CMP (Current market price) = ₹1				
Ans:	Value = DPS1 + DPS2 + Sale price				
	1+Ke (1+Ke) ²				
	141 = 5 + 7 + 200				
	$(1 + ke)$ $(1 + Ke)^2$				
	Using Hit & Trial like above, we can calculate Ke = 15%.				
	Note from Finance Acharya Jatin Nagpal -				
	So now you can see that a ques for calculating Ke using market price of share can be framed in many				
	different types. It is completely impractical to cram formulas for each type. (Also, if the ques is				
	twisted differently then all the crammed formulas will go useless!).				

vity \	Valuation 5A.7 WWW.	KRIVII.IN
6.	. Tiny topics (Wheels)	
I)		
	If current market price (CMP) < Intrinsic Value $ ightarrow$ under values	
	If CMP > Intrinsic Value -> over-valued. (Sell)	
	If CMP = Intrinsic Value → correctly valued (Hold)	
II)) HOLDING PERIOD RETURN (HPR)	(22a, b)
a.	a. Dividend Yield = <u>Dividend received during the year = D1</u>	
	PRICE at which investment is made P_0	
þ.	. Capital Gain Yield = <u>Capital gain</u> = <u>P1 - P0</u>	
	PRICE at which investment is made P_0	
C.	. Holding Period Yield (HPY) = <u>Total return</u> = $D_1 + (P_1 - P_0)$	
	Initial investment Po	
III)	CONCEPT OF FLOATATION COST	(21)
	Flotation cost means the cost that is incurred to issue new securities in the market.	
	(Obviously, this cost is relevant only when a company is issuing a new security).	
	If floatation cost is given, then deduct the floatation cost from the issue price and take the	net price.
	i.e. Net Price = Issue price x (1 — floatation cost).	
IV)) PV OF GROWTH OPPORTUNITY (PVGO)	(19)
	PVGO = Value with growth (-) Value without growth	

1.	Walter model (14, 4	15, 16)
	Value as per Walter Model = <u>DPS</u> + <u>r x REPS</u>	
	Ke Ke ²	
	Where : RPES = Retained Earnings per share r = return on equity	
NI - 1		
Note:	A very critical assumptions of Walter model: DPS, EPS, Ke, ROE, REPS ALL ARE ASSUMED TO BE CONSTAI	NI.
2.	Earnings Growth Model (Only use this if question specifically mentions!!)	(17)
	Value of share = Next year earnings or EPS_1 or $EPS_0(1 + q)$	
	Discount rate — Growth rate Ke -g Ke — g	
3.	PE Multiple Approach (Rarely used! Only use this if question specifically mentions!) (18a, b
	PE Ratio = <u>MPS</u>	
	EPS	
->	MPS = EPS × PE RATIO	
	Under this approach, PE ratio will not be given.	
	We will have to use the formula -> PE ratio = 1/Ke	
4.	H – MODEL	(31)
	$Value = DPS_0 (1 + G_n) + DPS_0 \times H \times (G_a - G_n)$	
	Ke – g Ke – g	
	Where, Ga = Abnormal growth rate	
	G _n = Normal growth rate	
	H = Years of abnormal growth ÷ 2	
5.	Yield approach (A/cing Method) (Ques Covered in)	bonds)
	Value = <u>Actual yield %</u> x Paid up value per share	

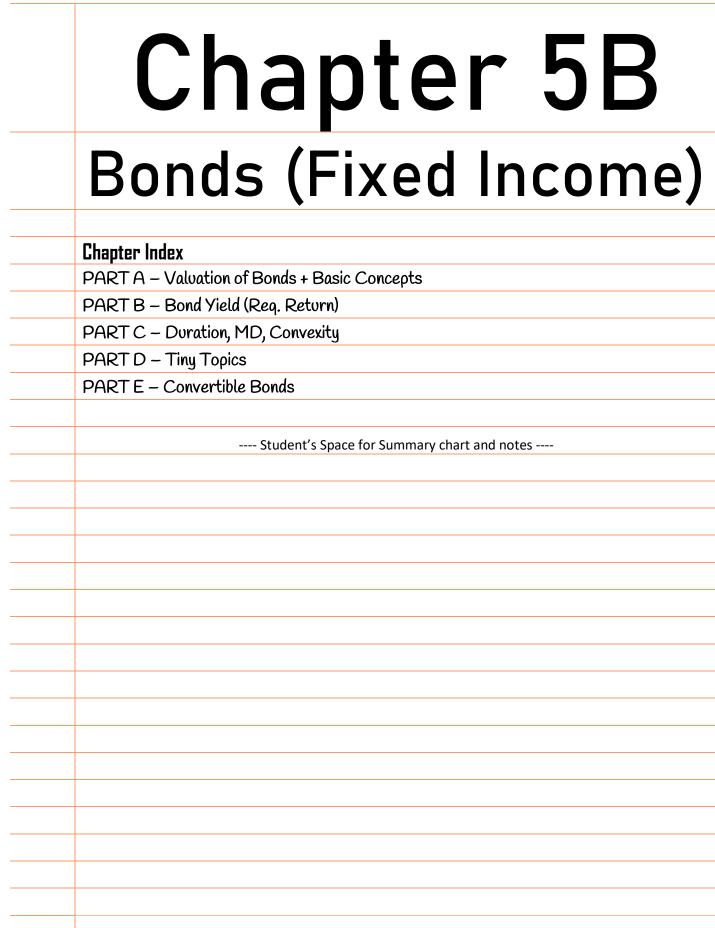

Equity Valuation

*	Actual Yield % =	Yield on Equity share × 100
		Equity share capital
*	Expected yield % =	Yield on similar company \pm risk premium of company.
	Expected gield 78

		RT	C	Special / Discrete Topics	
1.	Home-made dividend				(24)
	A scenario where you need at least	a minimum divid	dend p.a.		
	But if actual dividend < Required divi	dend $ ightarrow$ Then se	ell some shares	to get required CF.	
Ex.	Minimum required dividend = ₹5,00	0.			
	But dividend received = ₹4,000 only	J.			
	Current share price = ₹250.				
	So, sell 1,000/250 = 4 shares to get b	alance ₹1,000.			
2.	Value of company due	to a new p	<mark>oroject N</mark> l	<mark>PV</mark>	(20)
	New value of company = Existing va	lue \pm NPV of ne	w project.		
Ex:	CMP of Toolkit ltd. = ₹60 per share.	The co. has won	a new contra	ct which is expected to have	an NPV of
	₹30 crores. Find new MPS if there ar	e 10 crores outs	standing shares	•	
A:	Method 1 — Preferred				
	Current total market value of co. =	60 x 10 crores =	= ₹600 crores.		
	New value = Existing Market value +	NPV of new pro	ject = 600 + 50	= ₹650 crores.	
	New Market Price per Share = ₹650/1	0 = ₹65/share			
	Method 2:				
	New MPS = CMP + NPV per share				
	= 60 + 50 crores / 10 cror	es = 60 + 5 = ₹	₹65		
3.	Taxes				(26)
	Let us say there are two identical c	ountries. India 1	& India 2.		
		India 1	<u>India 2</u>		
	Gross Salary	1,00,000	70,000		
(-)	30% tax in India 1	(30,000)			
	NIL tax in India 2 (i.e. tax-free)				

quity \	<i>Jalvation</i>	5A.11	WWW.KRIVII.II
	Ques 1 - Which country should ye	ou prefer?	
	Ans: Indifferent. Prefer any as ''I	Net Salary" in both the countries is san	ne. Since, ultimately, you'll get
	₹70,000 in our bank account in ei	ither case.	
	Oues ? It let's say that you re	equire ₹200,000 as salary in India 1 (taxa	hle country 30% tax rate) then
			$\frac{1}{100} = \frac{1}{100} = \frac{1}$
		nand in India 2 (Tax-free country)?	₹1,40,000
		Gross salary is ₹200,000 = 200,000 × 0.7	
	Therefore, required salary in India	a 2 (Tax-Free country) =	₹1,40,000
Ex:	Currently dividends are taxed at	20% in the hands of shareholder.	
	You are an equity shareholder of	Urdhav ltd. Your current required retu	rn from the company is 15%.
	What would be your new require	ed return, if the govt. makes an amendn	nent related to dividend tax and
	Case 1 — Makes dividends complet	.ely tax-free.	
	Case 2 — Tax rate on dividends is	; reduced to 10%.	
	Case 3 $-$ Tax rate on dividends is	; increased to 30%.	
Ans:	Concept — Current NET required return (after tax) = 15% × (1-0.2) = 12%		
	So, I will require a NET return of	12% from the co. irrespective of the c	lividend tax rates.
Case 1:	If dividends are completely tax-f	ree, then required return = 12%.	
Case 2:	If 10% dividend tax is levied, the	n required return = 12 $\%$ \div (1 $-$ 0.1) = 13.3	33 %
Case 3:	If 30% dividend tax is levied, the	n required return = 12% ÷ (1 — 0.3) = 17.	.14%
4	When Denue charge	are Expected	(22)
4.	When Bonus shares Value = PVCI		(29)
	Due to Bonus our dividend & cas	h flow receipts may increase.	
Ex:	Currently I have 4 shares. DPS = 3	₹5/share	
	Total current dividend = 5x4 =₹20).	
	Received Bonus 1:4. New sho	ares = 4 + 1 = 5 shares.	
->	New total dividend = 5x5 = ₹25 (A	Assuming DPS remain same).	
Imp:	Bonus will also affect our sale pr	roceeds. For instance, in the above ex if	f you sell your shares for ₹100
	per share, then total sale procee		, 4 x 100 = ₹400)

PART A: Valuation of Bonds + Basic concepts

1.	INTRODUCTION
I)	Article ltd. issued 8%, 3 years debentures of ₹1,500 each to Mr. CA Principle What does this means?
	Interest rate / coupon rate on debenture = 8%
	Maturity / life / Tenor of bond = 3 years (This is represented by 'n')
	Face value of the bond = ₹1,500
	Note: Face value is the amount on which interest is paid. This is not the price or value of the bond.
	In this case, the interest that will be paid = 1500 × 8% = 120
II)	IMPORTANT ASSUMPTIONS (IF INFORMATION IS MISSING IN QUES)
	If life is missing in ques $ ightarrow$ Assume Perpetuity
	Face value is missing $ ightarrow$ ₹100 or ₹1000 as per the framing of ques.
	Redeemable value (RV) is missing in ques $ ightarrow$ Redeemable at par
III)	SOME USEFUL SHORT-FORMS THAT WE WILL USE THROUGHOUT THIS CHAPTER
	Interest -> Int or I
	Redeemable value -> RV
	Number of 'Periods' to maturity -> n
	Required yield or Discount rate of bond -> kd
	1% = 100 basis points (bps). Ex: 50 bps = 0.5%, 200 bps = 2% and so on.
2.	BOND VALUATION: TYPE 1 (Where examiner plays with Cash flows)
	Remember — Value of a financial asset = PVCI. The same is true for bonds as well.
I)	NORMAL BOND (PLAIN VANILLA BOND) (1)
	Interest paid yearly / quarterly etc. and Principal redeemed at maturity.
	Value = Interest × PVAF (kd%, n periods) + Redeemable value × PVF (kd%, n th period)
II)	PERPETUAL / IRREDEEMABLE BOND
	Interest received till perpetuity. Principal never paid back.
	Value = Interest / Kd (PV of perpetual Cash flows)

onds	5B.3 WWW.KRIV	II.IN
III)	ZERO COUPON BOND OR DEEP DISCOUNT BONDS	
	No interest paid. Only face value of maturity is received at maturity.	
	Value = $RV \div (1 + Kd)^n$	
IV)	CHANGING / VARIABLE COUPON RATE	(2)
	The coupon rate of bond changes over the life of the bond AS PER CONTRACT.	
Ex 1:	Weak & Power ltd. issued 5-year Bonds of ₹100 face value. The coupon rate for the first 2 years is 1	4%
	and for years 3-5 is 16%. Find the value of bond if the required rate of return is 12%.	
Ans:	Year Cash flow	
	1 100 × 14% = 14	
	2 100 × 14% = 14	
	$3 100 \times 16\% = 16$	
	4 100 × 16% = 16	
	$5 100 \times 16\% = 16$	
	5 Principal = 100	
	Value = <u>14</u> + <u>14</u> + <u>16</u> + <u>16</u> + <u>16</u> + <u>100</u> = ₹111.04	
	$(1.12)^1$ $(1.12)^2$ $(1.12)^3$ $(1.12)^4$ $(1.12)^5$ $(1.12)^5$	
	<u>Important – Do not get confused!</u>	
-	VARIABLE COUPON BOND VS FLOATING COUPON BONDS	
	In variable coupon bond the coupon rate changes as per contract i.e. the coupon rate is already de	fined
	in the contract. However, in case of floating rate bond the coupon changes as per prevailing market	rate
-	Also, do not confuse this type with 'Changing discount rate' or 'forward rates'. In case of changir	ng
	discount rate, the coupon paid on bond remains same but the discount rate (Kd) changes over perio	od.
V)	SELF-AMORTIZING BONDS	(4)
	Some principal amount is every year. Interest paid on the balance amount.	
	Value = Int. + Principal repaid + Int on balance amount + Principal repaid +	
	(1+kd) ¹ (1+kd) ²	

VI)	SPECIAL CASE 1 - INTEREST IS COMPOUNDED (RE-INVESTED)	AT KD.
,	Interest is compounded every year and received as a lumpsum an	
Illus:	If you deposit ₹100 today and interest on deposit is 14% p.a. Wha	t will be the future value after 3 yea
Ans:	$FV = PV \times (1+r)^n = 100 \times (1.14)^3 = ₹148.15$	
Ex 2:	Shana ltd. issued a 14%, 3-year bond of ₹100 Face value. The interes	st will be paid cumulatively after 3 ye
	along with the original principal amount of ₹100. Find the value of	the bond if your required return = 12
Ans:	Total Amount receivable after 3 years = 100 \times (1.14) ³ = 148.15	
	Value of bond = PVCI = <u>148.15</u> = ₹105.45	
	(1.12) ³	
VII)	SPECIAL CASE 2 - INTEREST IS COMPOUNDED AND RE-INVEST	ED AT A DIFFERENT RATE. (2
	Simply calculate future value of cash flows using the reinvestmen	t rate. Discount it to get bond value
Ex 3:	Blue Bear ltd. issued a 12% 3-year bond. You believe that interest	payments can be re-invested at 8%
	Find the bond value if required yield to maturity is 11.75%. Assume	e face value = 100.
Ans:	Year Cash flow Future value @ end of 3 years	
	1 $100 \times 12\% = 12$ $12 \times (1.08)^2 = 14$	
	2 $100 \times 12\% = 12$ $12 \times (1.08)^1 = 12.96$	
	3 12 + 100 = 112 $112 \times (1.08)^0 = 112$	
	<u>Total = 138.96</u>	
	Value of bond = PVCI = 138.96 / (1.1175) ³ = ₹99.57	

3.	BOND VALUATION: TYPE 2 (Where examine	er plays with discount rate
I)	SPOT RATES CHANGES OVER PERIOD	
Ех 4:		uield is as follows
LA 1.	Years Spot rate or Zero rate	
	1 8%	
	2 9%	
	3 years and above 11%	
Ans:		
	Value = PVCI = <u>10</u> + <u>10</u> + <u>10</u> + <u>10</u> + <u>10</u> = ₹97.4	48
	1.08 ¹ 1.09 ² 1.11 ³ 1.11 ⁴	
II)	FORWARD RATES	(19, 20a &b)
Ex 5:	: Find value of a 10%, 4-year bond with face value = ₹100. Required	yield is as follows
	Years Forward rates (FR)	-
	1 8%	
	2 9%	
	3 years and above 11%	
Ans:	: The bond will pay coupon of ₹10 p.a. (i.e. 100 × 10%).	
	Value = PVCI = 10 + 10 + 10 +	10 + 100 = ₹101.25
	1.08 1.08 × 1.09 1.08 × 1.09 × 1.11 1.08 >	< 1.09 × 1.11 × 1.11
III)	CREDIT RATINGS	
	In such ques we are not provided with kd directly. Rather info abo	out credit rating of bond and credit
	spread is given.	
Illus:	: Credit spreads of different bonds as per its credit rating is given	oelow. T-Bill rate is 5.8%
	Rating Spread Required Yield	
	AAA T-Bill rate + 0.8% 5.8% + 0.8% = 6.6%	
	AA AAA + 1.2% 6.6% + 1.2% = 7.8%	
	A AA + 1.95% 7.8% + 1.95% = 9.75%	0
	BBB A + 2.2% 9.75% + 2.2% = 11.95%	%

4.	BOND VALUATION: TYPE 3 (Valuation in b/w coupon dates) (50					
	We will understand this with the help of an example.					
Ex 6:	A 5-year bond was issued on 1-Jan-22. It will make annual coupon payment of ₹120 p.a. on its face valu					
	of ₹1000. Find the value of bond on 1-July-23. Required return on bond = 11% p.a.					
Ans:	Step 1 — Find the bond value as on next coupon date.					
	In this case, we want to calculate bond value as on 1 July, 2023. So, next coupon date = 31 Dec, 2023.					
	1 Jan 31 Jul 31 Dec 31 Dec </td					
	120 120 120 120+1000=1120					
	Date of bond issue. Not relevant X (This is PAST. Focus on FUTURE) Value of bond as on 31-Dec 23 (after receiving coupon) = PV of remaining cash flows = 120 x PVAF(11%, 3) + 1000 x PVF(11%, 3) = Rs.1024.437					
	Value of bond as on 31 Dec 23 = PV of remaining cash flows = $120 + 120 + 120 + 1000 = ₹1024.437$ 1.11 ¹ 1.11 ² 1.11 ³					
-	Now informally speaking, what I have on 31 Dec 23 = A bond worth ₹1024.437 + Coupon of ₹120. Total = 1024.437 + 120 = ₹1144.437					
	10tul = 1027.757 + 120 = <1177.757					
Step 2:	Value as on 1 July 23 = PVCI = ₹1144.437 / 1.11 ^{6/12} = ₹1086.25					
	Hence, value of bond as on 1 July 23 = ₹1086.25.					
II)	CLEAN PRICE VS DIRTY PRICE					
	Clean price = Exclusive of accrued interest					
	Dirty price = Inclusive of accrued interest = Clean price + Accrued interest					
	In the above example, Dirty price = ₹1086.25.					
	Accrued interest = 1000 × 12% × 6/12 = ₹60					

Bonds

5.	BOND VALUATION: TYPE 4 (Floating rate bond)					
I)	INTRODUC	TION				
	In case of	floating rate bond, the coupor	n rate is linked to a bench	mark rate such as LIBOR, MIBOR etc.		
Illus:	A 5-year Floating coupon rate bond with interest rate = LIBOR + 2%.					
	This means	that coupon amount is not fi	ixed for entire 5-years (ur	nlike traditional bonds). Instead coupon		
	amount sha	all be decided as per the prevai	ling LIBOR.			
II)	PROCESS	OF RESETTING COUPON RATE				
	A floating 1	rate bond's coupon rate reset	, at pre-defined intervals.	Let us understand it with an example.		
Ex 7:	A floating 1	rate bond is issued on 1 st Jan a	t LIBOR + 2%. It will pay i	interest semi-annually. Find the interest		
	that bond holder will receive on 30 th June and 31 st Dec respectively if LIBOR turns out as following:					
	Date	LIBOR				
	1 Jan	6.1 %				
	30 June	6.4 %				
	31 Dec 5.95%					
	Face value of bond = ₹1000.					
A:	The coupor	n amount to be paid on next r	eset date is decided on pi	revious date.		
	i.e. interest to be paid on 30 June will be decided as per the prevailing LIBOR on 1 Jan.					
		1 Jan		30 June		
	Prev	ailing LIBOR = 6.1%	Int. = 1000 x	8.1% x 1/2 = ₹40.50		
		icable rate = 6.1% + 2% 0 June = 8.1%				
	Date	Applicable LIBOR rate	Rate applicable	Interest amount		
	30 June	6.1% (i.e. 1 Jan LIBOR)	6.1% + 2% = 8.1%	1000 × 8.1 % × ½ = ₹40.50		
	31 Dec	6.4% (i.e. 30 Jun LIBOR)	6.4 % + 2% = 8.4%	1000 × 8.4% × ½ = ₹40.50		
III)	VALUE OF FLOATING RATE BOND ON RESET DATE (3)					
	A floating 1	rate bond always trades at par	on the reset date (i.e. da	ate on which the coupon rate is reset)		
	This is beca	use on reset date -> Market yi	eld = Coupon rate.			
	So, in the a	bove example, we can say tha	t the bond will trade at p	par on 1 Jan, 30 June and 31 Dec.		

IV)	VALUE OF FLOATING RAT	E BOND IN BETWEEN I	RESET DATES		
Ex 8:	In the above example, cal	culate value of bond 1st	^t March. 4-months	LIBOR on that date is (5.3% p.a.
Ans:	Cash flow as on 30 June	= Par value of floating	oond + Coupon am	ount	
		= 1000 + 40.5 = ₹1040.5			
	∴ Value on 1 st March = P\	/CI = <u>1040.5</u> = ₹	1012.49		
		1 + 0.083×4/12			
6.	BOND VALUATIO	<mark>)N:</mark> TYPE 5 (Diff	erent compo	ounding periods	5) (9
		Half-yearly	Quarterly	Monthly	
	Interest per period	Int p.a. ÷ 2	Int p.a. ÷ 4	Int p.a. ÷ 12	
	Yield per period	Yield p.a. ÷ 2	Yield p.a. ÷ 4	Yield p.a. ÷ 12	
	Number of periods	n x 2	n x ዓ	n x 12	
Ex 9:	A co. issued 12%, 4 years				
	value of the bond if inter			(ii) Quarterly	(iii) Monthly
Ans:		Half-yearly	Quarterly	Monthly	
	Interest per period	120/2 = 60	120/4 = 30	120/12 = 1	
	Yield per period	9% / 2 = 4.5%	9% / 4 = 2.2		
	Number of periods	4 x 2 = 8	4 x 4 = 16	4 × 12 = 1	18
	Bond value	60.PVAF(4.5 % , 8)	30.PVAF(2.25	5%, 16) 10.PVAF(0	.75%, 48)
		+ 1000.PVF(4.5%,8)	+ 1000.PVF(2		F(0.75%, 48)
		= ₹1098.93	= ₹1099.84	= ₹1100.46	

	PART B: Bond Yield (req. return)
1.	INTRODUCTION TO YIELD / REQUIRED RETURN / KD / YTM
I)	DISCOUNT RATE (also known as Required return, Cost of debt - Kd, YTM etc.)
-	EXPECTATION of investor or the required / desired rate of return of investor.
-	It is the rate USED TO CALCULATE THE PRESENT VALUE of cash inflows from an asset.
-	Depends on several market factors such as risk-free rate, risk factor of the company, inflation etc.
-	Can change from time to time due to change in market factors.
II)	COUPON RATE - Rate at which Interest is calculated on the debenture. It is paid as per the control
Illus:	Debenture — Face value = ₹100. Coupon rate = 7%.
	Interest on debenture = 100 × 7% = ₹7
2.	Relation between Yield & Value of bond.
I)	INVERSE RELATION
	INVERSE RELATION Bond Value and yield has an inverse relation. So, if yield increases -> Bond value falls and vice-versa.
I)	INVERSE RELATION Bond Value and yield has an inverse relation. So, if yield increases -> Bond value falls and vice-versa.
I)	INVERSE RELATION Bond Value and yield has an inverse relation. So, if yield increases -> Bond value falls and vice-versa. Brinjal Itd. issues 10%, 4-years bonds if FV ₹1000 each.
I)	INVERSE RELATION Bond Value and yield has an inverse relation. So, if yield increases -> Bond value falls and vice-versa. Brinjal Itd. issues 10%, 4-years bonds if FV ₹1000 each. Value if yield is 10% = 1,000
I)	INVERSE RELATION Bond Value and yield has an inverse relation. So, if yield increases -> Bond value falls and vice-versa. Brinjal ltd. issues 10%, 4-years bonds if FV ₹1000 each. Value if yield is 10% = 1,000 Value if yield is 12% = 939.25 -> when yield increases, value of bond falls. Value if yield is 8% = 1066.24 -> when yield decreases, value of bond rises.
I) Illus:	INVERSE RELATION Bond Value and yield has an inverse relation. So, if yield increases -> Bond value falls and vice-versa. Brinjal ltd. issues 10%, 4-years bonds if FV ₹1000 each. Value if yield is 10% = 1,000 Value if yield is 12% = 939.25 -> when yield increases, value of bond falls. Value if yield is 8% = 1066.24 -> when yield decreases, value of bond rises.

Finance	Acharya Jatin Nagpal (CA, FRM)	5B.10	Bonds			
I)	APPROX. FORMULA - WITHOUT TAXES		(10)			
	YTM = Interest + (RV - CMP) ÷ No. of periods					
	(RV - CMP) ÷ 2					
Note:	There are two types of taxes. Tax on intere	st income received by the bond-ho	older (income tax) and			
	capital gain tax. If nothing is mentioned, alw	ays assume 'INTEREST RATE TAX'.				
)	IRR METHOD		(10)			
	Value = $Int. 1 + Int. 2 +$ $(1+kd)^1 + (1+kd)^2$	<u>Int. n</u> + <u>Redeemable value</u> (1+kd) ⁿ (1+kd) ⁿ				
		CT.				
	PVCO PV					
	Using the IRR technique of Hit & trial, you ca	n solve for Kd				
	osing the interestingue of the k that, you ou					
	NOTES:					
1.	IRR is a better method (as it provides more	accurate answer). But in exam you	a can use approx. method			
	as well as it saves a lot of time (unless speci	fically mentioned to use IRR).				
2.	When calculating yield, should we take the ac	tual price of the bond or its Intrir	nsic value?			
	We require bond price to calculate yield.					
	IF NOTHING IS GIVEN IN QUES -> THEN ALWAY	S ASSUME VALUE = PRICE				
3.	Do not use approx. method to reverse calcu	llate bond value.				
)	YIELD OF PERPETUAL BOND		(12, 13)			
	Price of a perpetual bond = <u>Interest per peri</u>	od (Simply put al	ll values & calculate kd.)			
	Kd					
IV)	YIELD OF ZCB		(11)			
	Price of ZCB = Redeemable Value	(Simply put a	ll values & calculate kd.)			
	$(1 + \text{Kd})^n$					
V)	YIELD ON SIMILAR BOND					
	If Bond A and Bond B are 2 similar bonds. YT	M of Bond A = 12%. Then YTM of E	30nd B should also be 12%.			
	So, if ques gives details of Bond A & asks to	calculate YTM of similar bond -> th	en it will be = Bond A YTM.			

Bonds		5B.1	.1 W	WW.KRIVII.IN		
4.	Role of taxes when calculating YTM					
I)	IMPACT OF TAXES					
	Taxes reduce the amount of cash	n that you will r	eceive from an investment. (Remembe	er: Value = PVCI)		
		<u>TWO T`</u>	YPES OF TAXES			
	<u>г</u>					
	Interest rate tax		Capital gain tax			
	Interest (before tax)	xxx	Sale/ redemption value	xxx		
	Less: Tax on interest	<u>(xx)</u>	Less: Tax on capital gain*	(××)		
	Cash flow net of tax	xxx	CG tax = (RV _ Purchase price) x Tax	%		
			=> Cash flow net of tax	xxx		
-	Always take CF net of tax when a	calculating bond	value or yield (we are concerned with	n what CF we get)		
II)	CALCULATING YTM - WHEN TAX	ES ARE GIVEN	IN QUES	(15, 16, 17)		
	YTM (post-tax) = <u>Int (net of incor</u>	ne tax) + (RV* -	- CMP) ÷ No. of periods			
	(RV* - CMP) ÷ 2					
	where: RV* = Redemption value	(net of capital	gain tax)			
III)	CHOOSE A BOND (Taxable bond	vs Tax-free bo	nd)			
	Bond 1 - Taxable bond with net yi	eld = 12%				
	Bond 2 — Tax free bond with yield	d = 12%				
	Ans: Indifferent as yield on both	the bonds are so	ame. (Same as 'treatment of taxes' o	overed in Equity).		
5.	Misc. Points					
i)	Current yield = Interest / Bond pr	rice		(14)		
ii)	Yield spread = Bond yield — risk fre	e rate				
iv)	If Beta of bond is given in ques, t	then Market pric	e of bond = Bond value x Beta of bor	nd (19)		
V)	FLOATATION COST - IF floatati	ion cost is given	in ques, then take NET PROCEEDS	instead of CMP.		
	Net proceeds = Issue price — Floa	tation cost				
VI)	YTM OF SEMI-ANNUAL BOND			(18)		
	First calculate yield for 6 months.	. Give final answ	er in p.a. form. (6m yield x 2).			
	Similarly, for quarterly interest pa	ying bonds (yield	l per quarter x 4) and so on.			

PART C: Duration, MD, Convexity

1.	DURATION of bond (DoB)				
	DoB = weighted average	e time period until which the	initial investment is fully recovered.		
I)	CALCULATION OF MAG		(33		
	Macaulay's duration = \	Veighted amount (w x PVCI)			
		PVCI (or bond value)			
	Let us understand it wi	th an example.			
E× 10:	Calculate the Macaulay'	s duration of the following l	pond.		
	9%, 4 years bond of fa	ce value ₹1000. Current mark	et yield = 10%.		
Ans :	Year Cash flow	PV of CF (Kd = 10%)	Weighted amount (w x PVCI)		
	1 90	81.818	81.818 × 1 = 81.818		
	2 90	74.38	74.38 × 2 = 148.76		
	3 90	67.618	67.618 × 3 = 202.854		
	4 1000 + 90 = 10	90 744.485	744.485 × 4 = 2977.94		
		Total = ₹968.30	₹3411.372		
Note:	Bond value = PVCI = ₹9	68.30			
	Macaulay's duration = Weighted amount (w x PVCI) = 3411.372 = 3.523 years				
		PVCI (or bond value)	968.30		
	Prod (or bond value) 966.50				
	Shortcut method of calculating Bond duration				
	Duration = <u>1 x</u>	$1 \times \text{Interest} + 2 \times \text{Int} + \dots$	+ <u>n × Int.</u> + <u>n × Maturity value</u>		
	Bond value	(1 + kd) ¹ (1+Kd) ²	(1+kd) ⁿ (1+kd) ⁿ		
	Calculating above example using shortcut method				
		1 × 90 + 2 × 90 + 3 × 90 +	4 × (90 + 1000)		
	968.30	1.10 ¹ 1.10 ² 1.10 ³	1.104		
	= <u>3411.372</u>	= 3.523 years			
	968.30				

Bonds	5B.13	WWW.KRIVII.IN			
II)	NOTES ABOUT MACAULAY'S DURATION				
i)	i) Macaulay's Duration is always calculated in 'years'.				
ii)	In exam you can always use the Shortcut formula mentioned above (full marks v	will be awarded).			
	In fact, author strongly recommends using shortcut formula to save time.				
	Further, using 'Memory functions on calculator' you can even calculate Duration	in < 60 seconds.			
	DURATION OF ZCB	(32)			
	Duration of ZCB is always equal to its Maturity (no need to calculate).				
IV)	RELATIONSHIP OF DURATION OF BOND WITH:	(34)			
I.	With Yield - There is an inverse relation between Duration of bond & yield.				
II.	With Coupon rate - There is an inverse relation between the Duration & coupon r	ate.			
III.	With Tenure - There is a direct relation between the Bond's duration & tenure.				
Note:	Always use <u>Bond value</u> to calculate the duration of bond (& not market price)				
2.	Modified duration (MD)				
I)	THE CONCEPT OF SENSITIVITY OF BOND (WITH RESPECT TO YIELD)	(30)			
	Value of bond changes due to change in yield.				
	An investor investing in bonds would want to know how much the bond value w	ill change due to 1%			
	change in the yield.				
_	This is known as sensitivity of bond w.r.t yield.				
_	This is given by 'Modified duration' (MD).				
	Modified Duration = <u>Duration of Bond</u>				
	(or Sensitivity of bond) 1 + y/n				
	where y = yield p.a. & n = number of compounding in a year.				
	(take yield in decimals in above equation).				
II)	INTERPRETATION OF MD				
	If MD = 2.6, then it means that bond value will change by 2.6% due to 1% change	in yield.			
-	So, if yield increases by 1%, then bond value will fall by 2.6%.				
	Similarly, if yield falls by 1%, then bond value will increase by 2.6%.				

Finance Acharya Jatin Nagpal (CA, FRM)
--

	This leads us to the following equation:				
	% Change in Value of Bond = _ Modified Duration x % change in yield				
	(why minus sign along with the MD? Ans: Because Bond value & yield has inverse relationship.)				
Ex 11:	A bond has a Modified duration of 3.6 & current value of ₹980. Find new value if yield increases by 1.4%				
Ans:	% change in value of bond = -3.6 x 1.4% = -5.04%				
	Therefore, new bond value = 980 × (100 — 5.04%) = ₹930.608				
III)	MODIFIED DURATION OF A PERPETUAL BOND				
	MD of perpetual bond = <u>1 + Y</u> Y				
	Where Y = Yield of bond				
IV)	IS THE BOND VALUE CALCULATED BY USING MD 100% PRECISE?				
	No, Modified duration is an approx. concept. It gives us a very good estimate but it is not 100% precis				
	The concept of Duration of bond is completed by another concept 'Convexity of bond'.				
	(we'll study more about convexity later on in this chapter.)				
V)	APPLICATION OF DURATION OF BOND (DOB)				
i)	Interest rates are expected to fall in future -> Sell short duration and Buy long duration bonds.				
	(Because fall in yield means -> Increase in bond value. & value of Long duration bonds will increase mor				
ii)	Interest rates are expected to rise in future -> Buy short duration and Sell long duration bonds.				
	(Because rise in yield means -> Fall in bond value. & value of short duration bonds will fall less).				
iii)	Uncertain about future movements in yield but are risk averse.				
	Prefer short duration bonds as they carry less risk than long duration bonds.				
VI)	DURATION OF BOND PORTFOLIO (35, 36				
	Duration of bond portfolio = Weighted average duration of individual bonds in the portfolio				
	Weights = based on 'Current market price of the bond' (& not the face value of bond).				
	If no information about the current market price is given, then use the purchase price as current price				

5B.14

3.	Convexity					
I)	INTRODUCTION		(31)			
-	We earlier saw that value given by Modified duration is a good approx. of original value but it is not					
	100% precise. To get a more	e accurate measure of value, we Al	DD convexity adjustment to the MD.			
-	Convexity adjustment includ	les 2 steps:				
	Step 1 — Calculate convexity	of the bond.				
	Step 2 — ADD convexity adj	ustment to bond value calculated (using MD.			
-	Let us understand convexity	y calculation using below example:				
Ex 12:	A 3-year, 15% bond was issu	ed with a face value of ₹1000. Prev	railing yield to maturity (YTM) is 14% p.			
	Calculate new bond value if	yield changes to (a) 13%	(b) 15 %			
i)	Calculate it using full revalue	ation concept.				
ii)	Calculate it using MD.					
iii)	Calculate it using MD and Co	nvexity.				
iv)	Also give your comments.					
Ans:	Value of bond = Int x PVAF(YTM %, n) + RV x PVF(YTM %, n)					
i)	Value at 14% ytm (V0) = 150 × PVAF(14%, 3) + 1000 × PVF(14%, 3) = ₹1023.216					
	Value at 13% ytm (V+) = 150	× PVAF(13%, 3) + 1000 × PVF(13%, 3)	= ₹1047.22			
	Value at 15% ytm (V_) = 150 × PVAF(15%, 3) + 1000 × PVF(15%, 3) = ₹1000					
ii)		$\frac{150 + 2 \times 150 + 3 \times (150 + 1000)}{1.14^{1}}$	= 2.63 years			
	$\frac{MD = Duration}{(1 + y/n)} = \frac{2.63}{1 + 0.14/1} = 2.307$					
	Calculating new value using M.D. Change in bond value = - Modified duration x Change in yield					
		Yield = 13%	Yield = 15%			
	Change in bond value	-2.307 × -1% = 2.307%	-2.307 × 1% = -2.307%			
	New bond value	1023.16 + 2.307% = ₹1046.82	1023.16 - 2.307% = ₹999.61			

where convexity adjustment = Convexity × (∆ yield)² Yield = 13% Yield = 15% Change in bond value -2.307 × -1% = 2.307% -2.307 × 1% = -2.30 (+) Convexity adjustment 3.85 × (-0.01)² = 0.000385 or 0.0385% 3.85 × (0.01)² = 0.03 = Net change in bond value 2.3455% -2.2685% New bond value 1023.16 + 2.3455% = ₹1047.22 1023.16 - 2.2685% = iv) There was some difference when calculating the bond value using full revaluation and as per M However, this difference was almost entirely eliminated when we used convexity along with M Clearly, convexity adjustment helps in improving the precision of bond value as calculated using full revaluation and as per M 4. Bond immunization					
V. = Value of bond at upper yield V. = Value of bond at existing YTM Δ Yield = Change in yield (always take in decimals and not in %) Step 2: Value of bond = Value as per MD + Convexity adjustment where convexity adjustment = Convexity × (Δ yield) ² Vield = 13% Yield = 13% Yield = 13% Yield = 13% Change in bond value -2.307 × -1% = 2.307% -2.307 × 1% = -2.307 (+) Convexity adjustment 3.85 × (-0.01) ² = 0.000385 or 0.0385% 3.85 × (0.01) ² = 0.000385 = New bond value 102316 + 2.3455% -2.2685% New bond value 102316 + 2.3455%					
 Step 2: Value of bond = Value as per MD + Convexity adjustment where convexity adjustment = Convexity × (∆ yield)² Yield = 13% Yield = 15% Change in bond value -2.307 × -1% = 2.307% -2.307 × 1% = -2.30 (+) Convexity adjustment 3.85 × (-0.01)² = 0.000385 or 0.0385% 3.85 × (0.01)² = 0.03 = Net change in bond value 2.3455% -2.2685% New bond value 1023.16 + 2.3455% = ₹1047.22 1023.16 - 2.2685% iv) There was some difference when calculating the bond value using full revaluation and as per M However, this difference was almost entirely eliminated when we used convexity along with M Clearly, convexity adjustment helps in improving the precision of bond value as calculated usin 4. Bond immunization (37, 38, We now know that the value of bonds (or bond portfolio) can change due to a change in inte However, there is a strategy to immunize or save your portfolio from changes in value. Bond immunization can be achieved when: Duration of assets = Duration of liabilities Investors time horizon = Weighted average duration of bond (or bond portfolio) 					
where convexity adjustment = Convexity × (Δ yield)² Yield = 13% Yield = 15% Change in bond value -2.307 × -1% = 2.307% -2.307 × 1% = -2.307 (+) Convexity adjustment 3.85 × (-0.01)² = 0.000385 or 0.0385% 3.85 × (0.01)² = 0.03 = Net change in bond value 2.3455% -2.2685% New bond value 1023.16 + 2.3455% = ₹1047.22 1023.16 - 2.2685% iv) There was some difference when calculating the bond value using full revaluation and as per № However, this difference was almost entirely eliminated when we used convexity along with M Clearly, convexity adjustment helps in improving the precision of bond value as calculated using 4. Duration of assets = Duration of liabilities Investors time borizon = Weighted average duration of bond (or bond portfolio)					
or Investors time horizon = Weighted average duration of bond (or bond portfolio)					
Notes:					
1. If yield changes, then duration of bonds will change and hence we will have to re-immunize ou	our portfol				

onds	5B.17 WWW.KRIVII .
	PART D: Tiny Topics
1.	Holding period return (HPR) (same as equity share.
I)	WHEN DEBENTURES ARE SOLD/PURCHASED ONLY ONCE
•	Interest yield = Interest received during the year = Int.
	PRICE at which investment is made Po
•	Capital gain yield = <u>Capital gain</u> = <u>P1 - P0</u>
	PRICE at which investment is made Po
•	Holding Period Yield (HPY) = Total return = Int + (P1 - P0)
	(i.e. Int Yield + CG yield) Initial investment Po
II)	WHEN DEBENTURES ARE PURCHASED /SOLD MORE THAN ONCE (27)
	In such a case: Each investment = cash outflow
	Interest + sale of debenture = cash inflow
	\rightarrow Solve for IRR to get the return earned.
2.	BOND STRIPS (28, 29
	Bond value has 2 components -> Interest receipts and Principal receipts.
	Value = Interest x PVAF (Kd%, n) + RV x PVF(kd%, n)
	INTEREST STRIP PRINCIPAL STRIP
E× 13:	Bond -> FV = ₹100, coupon = 8%, yield = 5%, tenure = 6 years. Find the value of Interest & Principal str
Ans:	Interest strip = 8 x PVAF (5%, 6 periods) = ₹40.61
	Principal strip = 100 × PVAF (5%, 6 th period) = ₹74.62

3.	Callable and Puttable bonds
1)	CALLABLE BONDS
•/	The tenure of a bond is defined by the underlying bond agreement.
	However, sometimes the bond deed contains a term that the company can buy back the bonds (i.e. call
	them) before the maturity.
#	ICAI treatment in case of callable bonds (21, 23
•	Tenure of the bond = Call years
•	RV = amount at which company can call the bonds
•	Yield = Yield as per call years.
	This is known as YIELD TO CALL.
II)	PUTTABLE BONDS
	Here, investor has the choice to redeem the bond (at a pre-determined price) before the maturity.
#	ICAI treatment in case of puttable bonds (22, 24)
•	Tenure of the bond = Put years
•	RV = amount at which investor can redeem the bonds
٠	Yield = Yield as per put years.
	This is known as YIELD TO PUT .
III)	YIELD TO CALL (YTC) AND YIELD TO PUT (YTP)
	The formula is exactly same as YTM formula. Just that we will take call value or put value instead of RV
	Also, number of periods to be taken = Call years or put years respectively.
	YTC = Interest + (Call value - CMP) ÷ No. of periods
	(Call value - CMP) ÷ 2
	YTP = Interest + (Put value - CMP) ÷ No. of periods
	(Put value - CMP) ÷ 2
IV)	YIELD TO WORST (YTW)
	YTW = Lowest yield amongst all the available yields. (b/w YTM, YTC etc.)

Bonds	5B.19		WWW.KRIVII.IN		
5.	Bond Refunding		(41a, 41b, 41c)		
7.	Bond refunding - Whether we should refund existing bond	s and issue new bon	ds in its place?		
	This is a simple NPV decision. If NPV of bond refunding is p	ositive, then accept	it. Else reject.		
	NPV = PVCI — PVCO				
Step 1:	Calculation of initial outlay	(₹ in Million)			
*	Face Value of old bonds	xxx			
(+)	Call premium (net of tax) (Note 1)	xx			
(-)	Proceeds from new issues	(×××)			
(+)	Issue cost of new shares	xx			
(+)	Over-lapping interest (Net of tax)	xx			
(-)	Tax savings on unamortized discount & issue cost (Note 2) <u>(××)</u>			
	Cash outflow as on today (or PVCO): <u>xxx</u>			
Step 2:	Calculation of savings p.a.	Old	New		
*	Interest (net of tax)	xxx	xxx		
(-)	Tax savings on unamortized Discount & issue cost	<u>(</u> ××)	(××)		
	Net cash outflow	p.a. = <u>xxx</u>	xxx		
	Annual savings = Net cash outflow under old bonds — Net cash outflow under new bonds				
	NPV = PV of savings - PVCO (Note 4)				
	Notes:				
1.	Call premium per bond = Call price — Face value of old b	onds			
	or Face value of old bonds x Call premium %				
2.	Tax savings on unamortized = Discount & issue cost of old	d bonds x <u>Remaining</u>	life x Tax rate		
	discount & issue cost	Total li	ife		
3.	Rate to be used for discounting = Kd (i.e. After-tax cost c	of debt).			
	If Kd is not directly given in ques, then use after tax inte	rest cost of NEW BO	ONDS -> Interest (1-tax)		

PART E: Convertible Bonds

1.	Convertible bonds (42 - 47)					
-	The bond deed may include that the bonds can be converted after a certain period.					
	This conversion can be optional or mandatory (as per the bond deed).					
-	Conversion ratio $-$ It means the number of shares that will be issued upon conversion of bond.					
	For eg: A conversion ratio of 30 means -> Upon conversion you will receive 30 shares for every 1 bond.					
	We will understand the treatment of convertible bonds with the help of a master example.					
Ex 14:	MASTER EXAMPLE:					
	Face Value₹1,000Market price of Convertible Debenture₹900					
	Conversion Ratio 30 Straight Value of Debenture ₹700					
	8.5% Fully Convertible (into Equity shares) Debentures.					
	Market Price of Equity Share-₹25, Expected Dividend per Share- ₹1					
	Calculate:					
I)	FAIR CONVERSION VALUE OF DEBENTURE AS ON TODAY OR STOCK VALUE OF BOND.					
Ans:	Fair conversion value means the value that you will get if you convert your shares today only.					
	Fair conversion value = CMP of shares \times Number of shares that will be issued upon conversion					
	Fair conversion value 25 × 30 = ₹750					
II)	MARKET CONVERSION PRICE OR CONVERSION PARITY PRICE OF EQUITY SHARES.					
	That price of equity shares at which market value of convertible bond (CB) is equal to the fair conversion					
	value of CB.					
i.e.	Fair conversion value of CB = Market value of CB					
	MPS x No. of shares = Market value of CB					
	Conversion parity price = <u>Market value of CB</u>					
=>						
=>	No. of shares					

Bonds	5B.21	WWW.KRIVII.IN		
III)	CONVERSION PARITY PRICE PREMIUM PER EQUITY SHARE.			
	Premium means extra element. The conversion parity price of share is	s generally higher than the MPS.		
	This difference is known as Conversion parity price premium.			
	(in ₹) Conversion parity price premium = Conversion parity price — MP	S		
	(in %) Conversion parity price premium % = (Conversion parity price -	- MPS_/ MPS		
	(in ₹) Conversion Parity price premium = 30 — 25 = ₹5			
	(in %) Conversion Parity price premium (in %) = (30 - 25)/25 = 20%			
IV)	DOWNSIDE RISK OR PREMIUM OVER STRAIGHT VALUE OF DEBENTU	IRE.		
	Downside Risk = Market price of convertible bond - Price of NCB			
Or	Downside risk in % (2 alternates - CHOC	DSE ANY ONE)		
	l			
	Using NON convertible bond as base	Using convertible bond as base		
	Downside risk	Downside risk		
	Market price of NCB	Market price of CB		
	Downside risk = 900 _ 700 = ₹200			
	Downside risk (%) = 200/700 = 28.57% or 200/900 = 22.22%			
V)	PREMIUM IN CASE OF CONVERTIBLE BOND			
	The extra amount that you are paying for CB over the fair value of the bond.			
	Premium of CB = Market price of CB — Fair conversion value of bond			
	in % = Premium of CB / Fair conversion value of bond			
=>	Premium of CB = 900 _ 750 = ₹250			
=>	in % = 250 / 750 = 33.33%			
VI)	FAVOURABLE INCOME DIFFERENTIAL PER SHARE.			
	Option 1 - If bond is not converted -> Interest income = 8.5% × 1000 = ₹85			
	Option 2 - Convert bond and get 30 shares/bond (as per conversion r	atio) -> Dividend = 30x1 = ₹1		
=>	Favourable Income difference = 85 — 30 = ₹55			

	Acharya Jatin Nagpal (CA, FRM)	5B.22	Bonds
=>	Favourable Income differential Per share = 55/30 = ₹1	.8333 per share	
VII)	PREMIUM PAYBACK PERIOD		
	(Remember: Payback period = Investment / Cash flow	p.a. → It tells u	s in how many years our investme
	will be recovered.)		
	Concept: You want to buy 30 shares. Practically, you	have 2 options.	
	Option 1 — Buy a CB (& get 30 shares on conversion).	Cost = 1 × 900 =	: ₹900
	Option 2 — Directly buy 30 shares from market. Cost	= 30 × 25 = ₹750)
	Additional cost (of option 1 over 2) = 900 - 750 = 150		
	Option 1 is more expensive. Prefer option 1 only if inc	ome under opti	on 1 > income under option 2.
	Additional income under option = 85 — 30 = ₹55 (calcu	llated above).	
	Premium payback = <u>Additional initial investment</u> period Additional cash flow p.a.	<	It tells us in how many years th additional amount will be recover
	Premium payback period = 150/55 = 2.73 years		
VIII)	SHOULD YOU EXERCISE CONVERSION RIGHT?		
	If straight value of bond < Conversion value, then ex	ercise. Else not.	
	Ex: If straight value of a bond is ₹1020 and its conve	rsion value is or	ly ₹980, then it won't make any
	sense to exercise conversion. But if conversion value	is ₹1200, then p	refer conversion.
	sense to exercise conversion. But if conversion value	is ₹1200, then p	refer conversion.
	sense to exercise conversion. But if conversion value	is ₹1200, then p	refer conversion.
	sense to exercise conversion. But if conversion value	is ₹1200, then p	refer conversion.
	sense to exercise conversion. But if conversion value	is ₹1200, then p	refer conversion.
	sense to exercise conversion. But if conversion value	is ₹1200, then p	refer conversion.
	sense to exercise conversion. But if conversion value	is ₹1200, then p	refer conversion.
	sense to exercise conversion. But if conversion value	is ₹1200, then p	refer conversion.
	sense to exercise conversion. But if conversion value	is ₹1200, then p	refer conversion.
	sense to exercise conversion. But if conversion value	is ₹1200, then p	refer conversion.
	sense to exercise conversion. But if conversion value	is ₹1200, then p	refer conversion.
	sense to exercise conversion. But if conversion value	is ₹1200, then p	refer conversion.

Chapter 5C Rights, MMI, EV Part A - Rights, Money Market Instruments, Warrants, Pref. Shares

ance	Acharya Jatin Nagpal (CA, FRM)	5C.2	Rights, MMI, EV
	PAR	ΓΑ	Rights, MMI, Warrants, EV, Pref. shares
1.	Money Market Instruments (M	<mark>MI)</mark>	
I)	DISCOUNT VS YIELD		
А.	Discount is always on face value.		
Ex:	30% discount on Shirt. Price = ₹5000. Discount =	5000 × 30 % = ₹	1500. Effective price = ₹3500.
B.	Yield is always on 'Price'.		
Ex:	You purchased a share at ₹200. It paid a dividen	d of ₹5/share.F	ind dividend YIELD .
	Dividend yield = <u>Dividend</u> = <u>5</u> = 2.5%		
	Price 200		
	Common notations		
	F = Face value P = Price or Issue	price	M = Actual days to maturity
II)	Commercial Bills, Certificate of Deposit (CDs	;), Commercial	Paper, Treasury Bill (T-Bills)
-	These are issued at discount and the face value	is payable at mo	aturity.
-	Yield or effective rate = <u>F </u> P × <u>Days or M</u>	onths in a year	× 100
	P M		
-	Discount = <u>F P x Days or Months in a</u>	year x 100	
	F M		
III)	Price when yield or Interest rate is given in qu	ues	
	Price (= PVCI) = <u>Face value</u>		
	(1 + rate × M/365)		
Ex:	Z ltd. issued 91-days commercial paper worth ₹11	0 crores at a yie	eld of 12.04% p.a. Find issue price.
	Net amount of commercial paper price =	10 crores	= ₹9.7086 crores

Rights, MMI, EV

	REPO TRANSACTION Repo means — Repurchase agreement. It is a sort of loan arrangement but instead of keeping your security as collateral, you sell it to the					
	lender and simultaneously contract to buy it back at a slightly higher price. The difference b					
	sale price and re-purchase price represents interest co	ost.				
Ex:	Small Bank ltd. entered into a repo for 14 days @5.659	6 with Massive Bank ltd. in its securities worth				
	₹8.536 crores. Initial margin = 2%. Calculate -					
i)	Amount of loan that will be provided under repo aka	1 st leg of repo.				
ii)	Amount that will be repaid on maturity aka 2 nd leg of	геро.				
Ans:	Market value of securities =	₹8.536 Crores				
(-)	Initial margin @ 2% =	<u>(₹0.17072 crores)</u>				
=	Value of 1 st leg of swap =	<u>₹8.36528 crores</u>				
ii)	Value of 1 st leg =	₹8.36528 crores				
(+)	Interest under repo = 8.36528 × 5.65% × 14/360	₹0.01838 crores				
=	Value of 2 nd leg of swap =	₹8.38366 crores				
2.	<mark>Warrants</mark>					
	Warrant provides an option (right) to purchase Equity	shares of a co. at a specified price per share.				
	Theoretical Value of warrant = (CMP – E) x n					
)				
	Where — CMP = current market price, E = Exercise price	<i>i</i>				
	·	<i>i</i>				
Ē	·	e & n = no. of shares.				
Ē	Where — CMP = current market price, E = Exercise pric	e & n = no. of shares. e can never be negative.				
@ 3.	Where — CMP = current market price, E = Exercise price Since warrant is a right (not a compulsion) — Its valu	e & n = no. of shares. e can never be negative.				
	Where — CMP = current market price, E = Exercise price Since warrant is a right (not a compulsion) — Its valu Hence, minimum value of warrant = 0. If value comes	e & n = no. of shares. e can never be negative. negative using above formula, then take it as 0.				
	Where — CMP = current market price, E = Exercise price Since warrant is a right (not a compulsion) — Its valu Hence, minimum value of warrant = 0. If value comes Rights	e & n = no. of shares. e can never be negative. negative using above formula, then take it as 0.				
3.	Where — CMP = current market price, E = Exercise price Since warrant is a right (not a compulsion) — Its valu Hence, minimum value of warrant = 0. If value comes Rights Right issue provides a right to an existing shareholder	e & n = no. of shares. e can never be negative. negative using above formula, then take it as 0.				
3.	Where — CMP = current market price, E = Exercise price Since warrant is a right (not a compulsion) — Its valu Hence, minimum value of warrant = 0. If value comes Rights Right issue provides a right to an existing shareholder Ex-right price = nP ₀ + n <u>1</u> P ₁	e & n = no. of shares. e can never be negative. negative using above formula, then take it as 0. to purchase additional shares at discounted price.				
3.	Where - CMP = current market price, E = Exercise price Since warrant is a right (not a compulsion) - Its value Hence, minimum value of warrant = 0. If value comes Rights Right issue provides a right to an existing shareholder Ex-right price = <u>nP₀ + n₁P₁</u> n + n ₁ Where n = no. of existing equity shares, P ₀ = CMF	e & n = no. of shares. e can never be negative. negative using above formula, then take it as 0. to purchase additional shares at discounted price.				
3.	Where - CMP = current market price, E = Exercise price Since warrant is a right (not a compulsion) - Its value Hence, minimum value of warrant = 0. If value comes Rights Right issue provides a right to an existing shareholder Ex-right price = <u>nP₀ + n₁P₁</u> n + n ₁ Where n = no. of existing equity shares, P ₀ = CMF	e & n = no. of shares. e can never be negative. negative using above formula, then take it as 0. to purchase additional shares at discounted price.				

Т

4.	Value of preference shares
	Hint — Value = PVCI
	Preference share valuation is just like bonds. These shares provides a fixed rate of dividend every year
	and are redeemed at maturity.
	Value (=PVCI) = Interest x PVAF(r%, n) + Redeemable value x PVF(r%, n)

5C.4

Chapter 6 Portfolio Management

PART A – Portfolio Basics

PART B - Required Return (CAPM, CML, SML etc.)

PART C - Beta, TR = SR + USR

PART D - Tiny Topics

PART E - Special Topics(Sharpe cut-off, rebalancing......)

---- Student's Space for Summary chart and notes ----

	PART A: Portfolio Basics		
1			
1.	Introduction		
I)	QUICK FORMULAS RECALL (from Pre-chapter Data analysis)		
1.	Mean = Sum of all items or Item1 × Prob. + Item2 × Prob. +		
	Number of items		
2.	SD = $\sqrt{\frac{\sum (x-\bar{x})^2}{n}}$ or $\sqrt{\sum P(x-\bar{x})^2}$		
•	SD = Measure of TOTAL RISK . Higher SD = More risk		
•	Variance = Square of Standard deviation (σ^2)		
•	The standard deviation can never be negative. It can be zero but can never be negative.		
3.	Co-Variance = $\sum (x - \overline{x})(y - \overline{y})$ or $\sum P(x - \overline{x})(y - \overline{y})$ (5	5)	
	Covariance = Correlation(a,b) × σa × σb		
-	Covariance = Betaa × Betab × Variance of market portfolio (new formula !!)		
•	Covariance of an item with itself = Variance		
Ч.	$Correlation_{(x,y)} = Covariance_{(x,y)} $ (3)	3)	
	σ× σ _y		
•	Correlation of an item with itself is always = +1		
•	Since σ_x , σ_y are always positive. Therefore, sign of correlation depends on the sign of covariance.		
	If Cov = +ve> Correlation will be +ve. But if Cov = -ve> Correlation will be -ve.		
II)	COMMON SHORT-FORMS		
	Rm = Return of market Rf = Risk-free security return		
	Rp = Return of portfolio Rs = Return of security		
	Wa = Weight of asset 'A'		

III)	CHOOSE ANY	ONE SHARE					
Case 1:	SBI — Average	return = 12 % ,	SD = 8%				
	Nestle - Averag	ge return = 15%	%, SD = 8%				
Ans:	Nestle. (Same ri	sk — Higher ret	urn)				
Case 2:	SBI — Average	return = 15%,	SD = 12%				
	Nestle - Averag	ge return = 15%	%, SD = 8%				
Ans:	Nestle. (Same re	eturn — Lower	risk).				
Case 3:	SBI — Average	return = 12%,	SD = 10%				
	Nestle - Averag	ge return = 169	% , SD = 12 %				
Ans:	Here we can us	e -> Risk per ur	nit of return (i.	e. 1% return ear	n krne k liye kit	na risk lena pad rł	na h?)
	Risk per unit of	return of SBI	= 10/12 = 0.83%	, o			
	Risk per unit of	return of Nes	tle = 12/16 = 0.7	15%			
=>	> Choose Nestle (as we have to take less risk per unit of return compared to SBI)						
Ē	This 'Risk per unit of return' is popularly known as Coefficient of Variation						
	Coefficient of	Variation (CV) =					
	Average Return						
	Clearly, Lower t	he Better!					
Case 4:	Security ->	Α	В	С	D	E	
	Return ->	10%	14%	12%	11%	8%	
	Risk (o) ->	6%	8%	9%	6%	5%	
Ans:				ient of Variatior		070	
7 11 10.						in later part of t	this chapter)

2.	Return of security & portfolio
I)	RETURN OF INDIVIDUAL SECURITY (denoted by Rs)
a)	Rs when historical returns are given
	Use Average return = Σ Return ; \div Number of periods
p)	Rs when future returns & their respective probabilities are given
	Use expected return = $\sum R_i \times Probability_i$
c)	Holding period Return (%) = (P1 - P0) + D1 (Concept is already covered in stocks & bonds)
	PO
	We can use any of the above method to find return (as per framing of the ques.)
I)	RETURN OF PORTFOLIO (denoted by Rp)
	Return of portfolio = weighted average return of components
	$R_{\rm P} = W_a R_a + W_b R_b + \dots$
)	CALCULATION OF MARKET RETURN (6)
	Theoretically, market portfolio consists of all the marketable assets.
<u>.</u>	Market return = <u>(Total P1 - Total P0) + Total Dividend</u>
	Total PO
3.	Risk of stock & portfolio
	Risk is given by Standard deviation
I)	RISK OF STOCK
	Risk of stock = SD of stock = $\sqrt{\frac{\sum (x - \overline{x})^2}{n}}$ or $\sqrt{\sum P(x - \overline{x})^2}$
)	RISK OF PORTFOLIO
	Risk of portfolio = SD of portfolio
	Calculate return of portfolio of each year (x). Use the return data to calculate portfolio SD.
	SD = $\sum (x - \overline{x})^2$ Or $\sqrt{\Sigma P(x - \overline{x})^2}$
	$\sqrt{\frac{n}{n}}$

6.4

Portfolio Management

Finance Acharya Jatin Nagpal (CA, FRM)

III)	PORTFOLIO VARIANCE – SHORTCUT FORMULA (1,2,4) $= \frac{2}{3}$ with $\frac{2}{3}$ shocks $= (1, 4, 5)^2 + (2, 4, 5)^2 + (2, 5, 5)$,Τ,
•	$\sigma_{p}^{2} \text{ with 2 stocks} = (w_{a}\sigma_{a})^{2} + (w_{b}\sigma_{b})^{2} + 2w_{a}w_{b}(\sigma_{a}\sigma_{b}r_{a,b})$	
•	$\sigma_{p}^{2} \text{ with 3 Stocks} = (w_{a}\sigma_{a})^{2} + (w_{b}\sigma_{b})^{2} + (w_{c}\sigma_{c})^{2} + 2w_{a}w_{b}.Cov_{(a,b)} + 2w_{a}w_{c}.Cov_{(a,c)} + 2w_{b}w_{c}.Cov_{(b,c)}$ $\sigma_{p}^{2} \text{ with 4 Stocks} = (w_{a}\sigma_{a})^{2} + (w_{b}\sigma_{b})^{2} + (w_{c}\sigma_{c})^{2} + (w_{d}\sigma_{d})^{2} + 2w_{a}w_{b}.Cov_{(a,b)} + 2w_{a}w_{c}.Cov_{(a,c)} + 2w_{a}w_{d}.Cov_{(a,c)}$	b.
•	$2w_{bwc}.Cov_{(b,c)} + 2w_{bwd}.Cov_{(b,d)} + 2w_{cwd}.Cov_{(c,d)}$	<i>ı</i>) -
•	SD of portfolio (σ_P) = $\sqrt{Variance}$	
•	Remember that $COV_{(a,b)} = \sigma_a \sigma_b r_{(a,b)}$	
	So, above formula can also be written as:	
	$\sigma_{\rm p}^2 = (w_a \sigma_a)^2 + (w_b \sigma_b)^2 + 2 w_a w_b (\sigma_a \sigma_b r_{a,b})$	
	Similarly, for portfolio with 3 stocks, 4 stocks etc.	
4.	Role of correlations in a portfolio	(8)
	Strong Weak Weak Strong -1.0 -0.5 0 +0.5 +1.0 Negative Correlation Positive Correlation Higher the correlation, more the portfolio SD (risk) and hence lesser the benefit of diversification.	
I)	SHORTCUTS FOR CALCULATING SD — Only applicable when Portfolio consists of only 2 securities	
í.	When $r = +1$ -> $\sigma_P = W_a \sigma_a + W_b \sigma_b$	
	i.e. When r = +1 $ ightarrow$ SD of portfolio = Weighted average SD (i.e. MAXIMUM POSSIBLE RISK)	
íí.	When $r = 0$ -> $\sigma_{P} = \sqrt{(W_a^2 \sigma_a^2 + W_b^2 \sigma_b^2)}$	
ííí.	When $r = -1$ -> $\sigma_p = W_a \sigma_a - W_b \sigma_b$	
	SD can never be negative. So, if SD comes out to be negative using the above shortcut formula, then	l
	ignore the negative sign.	
II)	EXCEPTION	
	The above shortcuts discussed are only applicable if there are only 2 shares in our portfolio.	
Ŧ	However, if $r = +1$, then SD of portfolio = always equal to weighted average SD.	
	Since there is no benefit of diversification in this case.	

6.6

->	$\sigma_{p}^{2} = (W_{risky} \sigma_{risky})^{2} + 0 + 0 $ $\sigma_{p} = \sigma_{Risky} \times W_{risky}$ (As $\sigma_{rf} = 0$)
	$\sigma_{p}^{2} = (Wrisky \sigma_{risky})^{2} + (Wrf \sigma_{rf})^{2} + 2Wrisky \cdot Wrf(\sigma_{risky} \cdot \sigma_{rf} \cdot r_{a,b})$ $\sigma_{r}^{2} = (Wrisky \sigma_{risky})^{2} + 0 + 0 \qquad (As \sigma_{rf} = 0)$
	$\frac{\text{Proof:}}{2}$
	Portfolio risk = $\sigma_{Risky} \times Weight of risky asset$
-	Portfolio return = Weighted average return
	Risk of risk-free security = 0 (obviously). Therefore, its SD = 0.
6.	Portfolio of a Risk-free security and Risky security(% & E
	Theree, no fisk reduction in this case. i.e. we can say that portfolio fisk is maximum when r - +1.
	When r = +1, portfolio risk = weighted average risk Hence, no risk reduction in this case. i.e. we can say that portfolio risk is maximum when r = +1.
þ)	Will there be any risk reduction if $r = +1$?
	= 15% - 12.66% = 2.34%
	Risk reduced = Weighted average risk — Actual risk of portfolio
	σ _{a+b} = 0.1266 i.e. 12.66%
	$\sigma_{a+b}^2 = (0.12 \times 0.5)^2 + (0.18 \times 0.5)^2 + 2 \times 0.5 \times 0.5 \times (0.12 \times 0.18 \times 0.4) = 0.01602$
	But portfolio risk is:
/ 110.	
Ans:	Weight of A = Weight of B = 30 % Weighted average risk = 12% × 0.5 + 18% × 0.5 = 15%
Ex:	σa = 12%, σb = 18%, r(a,b) = 0.4 Weight of A = Weight of B = 50%
	portfolio level. This is known as risk reduction.
	Risk of a portfolio is not weighted average risk. Due to benefit of diversification, the risk is reduced at
5.	Risk reduction in portfolio
	& so on
_	If there are 4 shares in our portfolio: $\sigma_{P} = W_a \sigma_a + W_b \sigma_b + W_c \sigma_c + W_d \sigma_d$

6.7

	Portfolio of Mr. Sawdhan consists of a risky asset and a risk-free asset.						
		Expected re	eturn	Weight	SD of return (Risk)		
	Risky asset	14%		70 %	22%		
	Risk-free security	6 %		-	-		
i)	Find the expected re	d the expected return on the portfolio.					
ii)	Also calculate the portfolio risk (i.e. portfolio sd		portfolio sd)				
Ans:	i) Portfolio return =	Weighted average	ge return	= 6% × 0.3 + 14%	% × 0.7 = 11.6%		
ii)	Portfolio risk (op) = c	5Risky × Wrisky		= 22 % × 0.7	= 15.4%		
Note:	If ques is silent, alwo	nys assume Rf in	vestment rat	e = Rf borrowing	rate.

	C						

6.8

PART B: Required Return (CAPM, CML, SML etc.)

1. Types of risks

I) TOTAL RISK = σ^2 = SYSTEMATIC RISK + UNSYSTEMATIC RISK SYSTEMATIC RISK

	SYSTEMATIC RISK	UNSYSTEMATIC RISK OR IDIOSYNCRATIC RISK
	Market risk / Undiversifiable risk	Diversifiable risk / specific risk / Residual risk
1.	Risk due to broad factors such as global recession,	This risk arises due to industry or company specific
	pandemic, war, political instability etc.	factors such as strike, loss due to theft etc.
2.	Cannot be eliminated by diversification.	It can be controlled via diversification.
3.	Eg: A global pandemic affects all the businesses, let	Eg: A local strike in a factory of a company does
	it be cars, hotels, banking etc.	not impact a well-diversified portfolio.

2. Market portfolio

I) INTRODUCTION TO MARKET PORTFOLIO

- Theoretically, Market portfolio = A portfolio consisting of all the marketable securities.

- It is perfectly diversified and hence **no unsystematic risk** is left in the market portfolio.

- Practically, we may use a market index such as Nifty or Sensex as a proxy for market portfolio.

II) RISK OF MARKET PORTFOLIO

Total risk = Systematic risk + Unsystematic risk

Since, USR = 0 in case of market portfolio

Total risk of market portfolio = Systematic risk or SD of market portfolio (5m) = Systematic risk

- or SD of market portfolio (σ_m) = Systematic risk
- III)
 MARKET RISK PREMIUM

 Let's say that Return on Govt bonds (Rf) = 6%.

 Return on market portfolio say S&P 500 (Rm) = 14%

 There existing a column for investing in Market and Ifalia 14 14 8%
 - Then additional return for investing in Market portfolio = 14 6 = 8%.
 - This additional return is also known as 'Market risk premium (MRP)'.
 - MRP = Rm Rf.

3.	Risk of Individual security	
	An individual security contains both systematic risk (SR) and unsystematic risk (USR).
I)	HOW TO MEASURE THE SYSTEMATIC RISK CONTAI	NED IN A SECURITY
	Two Ways to meas	ure SR of a security
	Relative Measure	Absolute measure
Ex:	Golu's weight is 1.4 times the weight of an average	Weight of an average India = 60 Kg.
	Indian.	Golu's weight = 60 x 1.4 = 84 Kg
	Here, Golu's weight is defined in relative terms.	Here, Golu's weight is defined in Absolute terms.
-	We use Beta as a Relative measure of SR in a	For absolute measure, we will use Sharpe's Index
	security.	Model (covered later on in this chapter).
II)	BETA = RELATIVE MEASURE OF SYSTEMATIC RISK	IN A SECURITY
-	Beta tells us about the sensitivity of a stock w.r.t. t	he market portfolio.
-	Beta -> If market changes by 1%, then how much w	ill the stock change?
-	Note that Beta is always measured in "TIMES" (& no	t in percentage)
-	By its very definition, Beta of market portfolio = 1	
Illus:	Beta of Delta Corp = 1.8. If stock market fell by 1%,	then what is the expected fall in Delta corp.
	Expected fall in Delta Corp = 1% × 1.8 = 1.8%	
	Hence, Delta corp is 1.8 times riskier than the market	portfolio.
4.1	PRICING MODELS – CAPM	(12a,b,c, 13)
	Required return as per CAPM = Rf + (Rm — Rf) × Beta	
`	-	
I)	WHAT DOES CAPM TELLS US?	
	CAPM tells us REQUIRED RETURN (discount rate/Fai	, , , , , , , , , , , , , , , , , , ,
	i.e. it tells us 'कि कितनी return मिलनी चाहिए वि	गसा stock स '
		•
) 	OVER-VALUED AND UNDER-VALUED AS PER CAPH	1
Illus:	Required return from a stock as per CAPM is 15%.	
	Case 1: You can earn a return of 20% on this stock.	
	Great! You can earn extra return. You will surely buy	I IT. THIS STOCK IS UNDERVALUED.
	Case 2: You can earn a return of 10% on this stock.	
	This is less than your required return. You won't bu	y it. This stock is OVERVALUED.

Finance Acharya Jatin Nagpal (CA, FRM) 6.10

4.	Market risk-return relationship = <u>Rm — Rf</u>		
	σm		

PART C: Beta, TR = SR + USR 1. Beta 1) **BETA CALCULATION** (17, 18a, 18b, 20, 27) Change formula Correlation formula Covariance formula Beta = Change in security return Covariance_(s,m) $r_{s,m} \times \sigma_{security}$ Change in market return Variance(market) σ market II) NOTES Always use security return figures to calculate Beta (& not price figures directly). 1. Change formula can be used only if 2 period data is given. If data of more than 2 periods is given, then 2. either use correlation formula or covariance formula. Covariance formula and correlation formula are same. 3. Beta = Covariance(s,m) $r(s,m) \times \sigma_s \times \sigma_m = r(s,m) \times \sigma_s$ = σ_m^2 Variance(m) $\sigma_{\rm m}$ Beta of portfolio = Weighted average beta of components. (22b, 23) 4. Since beta represents systematic risk, we cannot diversify it by building a portfolio. 5. Beta of market = 1 (obviously) 6. Types of stocks 6. Beta > 1 = Aggressive stocks or risky stocks. These are more risky than the market portfolio. Beta < 1 = Defensive stocks or less risky stocks. These are less risky than the market portfolio. Beta = 1 : Neutral stocks. These are as risky as the market portfolio. 7. Can there be negative beta stocks? Generally, NO! Because there is hardly any company which has opposite relation with the economy such that when market rises, it falls and when market falls, it rises. Beta of my portfolio = 1.4. Find Rp if Rm = 15%. (22a) Ex: Ans: $Rp = 15\% \times 1.4 = 21\%$ Beta of my stock is 0.8. Find Rs if market fell by 4%. Ex:

Ans: fall in stock = 4% × 0.8 = 3.2%

I) Ex:	Recall: Beta of portfolio (consisting of risky assets and risk-free assets) = W _{risky} × Beta _{risky} PORTFOLIO MANAGER WILL BRING NEW RISK-FREE INVESTMENT
Ex:	PORTFOLIO MANAGER WILL BRING NEW RISK-FREE INVESTMENT
	Let us say that current beta of our existing risky portfolio = 1.5. Value of portfolio = 20 lacs.
	New desired beta = 1.2. How much new risk-free investment should be brought in?
A:	Let amount of new risk-free investment be 'X'.
	Then: New portfolio value = 20L + X
	Weight of risky assets (W _{risky}) = 20L / (20L + X)
	Portfolio beta = W _{risky} × Beta _{risky}
	$1.2 = 1.5 \times 20L$
	20L + X
	20L + X = 25L
	X = 5 lacs
	Portfolio manager should bring in 5 lacs of risk-free investment to achieve target beta of 1.2.
II)	EXISTING PORTION OF PORTFOLIO WILL BE SOLD TO ACHIEVE DESIRED BETA VALUE
Ex:	Current beta of our existing risky portfolio (Betarisky)= 1.5. Value of portfolio = 20 lacs. How muc
	of existing portfolio should be sold and invested in Rf securities to achieve target beta of 1.2?
A:	Let amount of existing portfolio sold and invested in risk-free securities be 'X'.
	Then: New portfolio value = 20L
	Weight of risky assets (W _{risky}) = (20L — X) / 20L
	Portfolio beta = W _{risky} × Beta _{risky}
	$1.2 = 1.5 \times 20L - X$
	20L
	16L = 20L — X
	X = 4 lacs
	Portfolio manager should sell 4 lacs of existing portfolio to achieve target beta of 1.2.

3.	Breaking down Total risk (TR) in	to SR & USR (19, 28, 29, 30, 31)			
I)		Risk (TR) = σ_s^2 (i.e. Variance)			
'/		es variance as a measure of total risk)			
	L				
•	SR = Betas ² × σ m ²	Unsystematic risk = Total risk — Systematic risk			
	(i.e. Beta of security × variance of MARKET)				
	Or	Note: Since TR (i.e. Variance) as well as SR are both			
•	SR = $r_{s,m}^2 \times \sigma_s^2$	in square form, the USR that we get is also in squar			
	(i.e. Coeff ⁿ of determination x variance of SECURITY)	form.			
II)	AT PORTFOLIO LEVEL: Tota	al Risk (TR) = σ_{P}^{2} (i.e. Variance)			
		use portfolio beta rather than security beta)			
	Systematic Risk (SR)	Unsystematic risk (USR)			
•	SR = Betap ² × σm^2	Unsystematic risk = Total risk — Systematic risk			
	(i.e. Beta of portfolio x variance of MARKET)	Or			
	Or	$USR_{p} = USR_{a}W_{a}^{2} + USR_{b}W_{b}^{2}$			
•	SR = $r_{p,m}^2 \times \sigma_p^2$	(No need to square USR again as it is already in			
	(i.e. Coeff ⁿ of determination × PORTFOLIO variance) square form.)				
III)	NOTES				
1.	Generally, USR given in ques is already in square form	n. Also, the USR that we calculate using 'TR $=$ SR' is			
	already in square form. Hence, do not square again.				
	(Imp - Don't forget to take squares if USR is not g	iven in square form.)			
2.	Why is there no '2WaWb USRa USRb r(a,b)' component in the calculation of portfolio USR?				
Ans:					
7 11 10.

•	Excess return due to higher risk = Excess return (-)	Extra return due to skill			

Finance	Acharya Jatin Nagpal (CA, FRM) 6.18 Portfolio Management					
	PARTE: Special Topics (Sharpe cutoff, Rebalancing)					
1.	Levered and Unlevered Beta					
)						
I)	WHEN BETA OF DEBT IS NOT GIVEN (I.E. WE ASSUME DEBT BETA = 0)					
	Complete video on this topic is available on YouTube. Search 'Krivi Eduspace Levered beta'					
Notes:	Unlevered Beta (B_{UL}) = Beta of company without any debt (leverage). It is also called Asset beta.					
	Levered beta (B_L) = Beta of company with debt (leverage). It is also called Equity beta.					
	Levered beta is also called Geared beta or Equity beta.					
	Unlevered beta is also called ungeared beta or Asset beta.					
	$B_L = B_{UL} \{1 + Debt(1-tax)\}$					
	Equity					
I)	USING PROXY FIRM BETA					
	Complete video on this topic is available on YouTube. Search 'Krivi Eduspace Levered beta'					
	Steps to solve:					
1.	Find unlevered Beta using proxy firm info.					
2.	Calculate Levered beta using the Unlevered beta calculated in step 1.					
Ex:	Let us say there are 2 companies in the chemical business (same of line of business).					
	Co. X is a private unlisted co. with D:E ratio = 1:4 and applicable tax rate = 20%.					
	Whereas Co. Y is a listed co. with D:E ratio = 1:2 and applicable tax rate = 30% . Since Co. X is an unlisted co. so we are unable to find its beta directly. Beta of Co. X is known					
	Since, Co. X is an unlisted co., so we are unable to find its beta directly. Beta of Co. Y is known and is equal to 1.89. You are required to calculate the equity beta of Co. X.					
A:	Step 1 - Find Unlevered beta of Co. Y					
	$B_L = B_{UL} \{1 + \text{Debt}(1-\text{tax})\}$					
	Equity					
	$1.89 = B_{UL} \{1 + 1(1-0.3)\} \implies B_{UL} = 1.4$					
	2					

6.19

WWW.KRIVII.IN

	Step 2 — Find Levered beta of Co. X using Unlevered Beta calculated above.
	$B_{L} = B_{UL} \{1 + Debt(1-tax)\}$
	Equity
	$B_L = 1.4 \{1 + 1(1-0.2)\}$ => $B_{UL} = 1.68$
	4
	Hence, Levered beta or equity beta of Co. X is 1.68.
III)	CALCULATING CO. BETA WHEN BETA OF DEBT IS GIVEN. (38, 39)
	Company's asset beta = Weighted average beta of equity and debt.
	Asset Beta = Beta _{Equity} × \underline{E} + Beta _{Debt} [D (1 - tax)]
	E + D(1 - t) E + D (1 - tax)
	Notes:
1.	Debt amount is taken 'Net of tax'.
2.	Technically speaking, this formula and the above formula (of levered beta) are same.
	Because if Beta of Debt = 0, then
	Asset Beta = Beta _{Equity} × \underline{E} + 0 × $[D(1 - tax)]$
	E + D(1 - t) $E + D(1 - tax)$
	Asset Beta = Beta _{Equity} × <u>E</u>
	E + D(1 - t)
	$Beta_{Equity} = Beta_{Asset} \{ E + D(1 - t) \}$
	E
	$Beta_{Equity} = Beta_{Asset} \{1 + \underline{D(1 - t)}\}$ (Hence, the 2 formulas are same if $B_{Debt} = 0$)
	E
3.	Sometimes beta of debt is not directly given in ques. In such cases, it can be calculated as:
	Debt Beta = Kd — Rf (Where Kd = cost of debt and Rm = market return)
	Rm = Rf
4.	Finally, if Debt beta is not directly given, and also information required to calculate it is not
	available, then simply assume debt beta = 0.

2.	Portfolio Rebalancing
1)	TYPE 1 – WHEN DESIRED WEIGHT (RATIO) OF EACH STOCK IS GIVEN. (42)
17	Desired weight required of each stock in the portfolio. For ex: I may want that weight of each
	stock in my portfolio should be equal.
Step 1:	Ascertain the required weight of each stock. It may be directly given in the ques or you may
	have to calculate it.
Step 2:	Calculate total value of portfolio on the rebalancing date (V_P)
	New amount of each stock = $V_P \times Required$ weight
II)	TYPE 2 - CONSTANT RATIO MIX POLICY OR CONSTANT PROPORTION MIX POLICY (41)
	Here we decide to invest our total portfolio amount into aggressive (equity) securities and
	conservative securities (bonds). The proportion (ratio) of both the components is decided.
	Some notations for easier understanding:
	Value of aggressive securities (equity) = V_A
	Value of conservative securities (bonds) = V_c
	Value of portfolio = Vp
Step 1:	Calculate the opening amount to be invested in aggressive and conservative securities.
	For ex: If you want to invest ₹200,000 EQUALLY in equity and debt, then
	V _A = 200,000 × 0.5 = ₹100,000
	V _C = 200,000 × 0.5 = ₹100,000
Step 2:	Recalculate Value of equity and Value of debt.
	Ex: Price of equity on the date of purchase = ₹20. Now new price of equity = ₹22.
	Then new value of Aggressive (equity) portfolio = (1,00,000 / 20) × 22 = ₹1,10,000
Step 3:	Calculate total portfolio value: Vp = VA + VD
	and bifurcate this value as per the original required weights.
	Using above ex: VP = 1,10,000 + 1,00,000 = ₹2,10,000
	Required $V_A = 2,10,000 \times 0.5 = 1,05,000$
	$V_D = 2,10,000 \times 0.5 = 1,05,000$
	Hence, transfer ₹5,000 (i.e. 1,10,000 — 1,05,000) from equity to debt to reach the required weight.

6.21

III)TYPE 3 - CONSTANT PROPORTION INSURANCE POLICY (CPIP)(40)In this case, the investor decides a floor value below which her portfolio should not fall.Total portfolio amount is invested partly in aggressive securities (equities) and partly in conservative securities (debt or risk-free securities).Ex:Total amount to be invested (VP) = ₹10L.Floor value of investor (V1000) = ₹8L.Multiplier (for aggressive securities) = 2Ans:Step 1: Calculate the opening valuesAmount in Aggressive securities (equity) VA = (VP - V1000) × Multiplier = (10L - 8L) × 2 = 4LAmount in Conservative securities (debt) VC = Balance amount = VP - VA = 10L - 4L = 6LStep 2:Calculate new values on rebalancing dateCalculate new value of equity and debt using the info given in ques.For ex: If equity Index on investment date was 20,000 and index on rebalancing date is 24,000.Then New value of equity = (4L / 20,000) × 24,000 = ₹4,80,000Step 3:Rebalancing portfolio (same as step 1) New VP = VA + VC = 4,8L + 6L = 10.8LVA = (VP - Vfloor) × Multiplier = (10.8L - 8L) × 2 = 5.6LVC = Balance amount = VP - VA = 10.8L - 5.6L = 5.2LHence, sell ₹80,000 (6L - 5.2L) of conservative securities and buy ₹80,000 worth of equity.NOTES:1If floor value % is not directly given in ques, then you can calculate it as:Current value - Minimum value (as given in ques), + 100Current value				
Total portfolio amount is invested partly in aggressive securities (equities) and partly in conservative securities (debt or risk-free securities). Ex: Total amount to be invested (Vr) ₹10L. Floor value of investor (Vr100r) = ₹8L. Multiplier (for aggressive securities) = 2 Ans: Step 1: Calculate the opening values Amount in Aggressive securities (equity) VA = (VP - Vr100r) × Multiplier = (10L - 8L) × 2 = 4L Amount in Conservative securities (debt) Vc = Balance amount = VP - VA = 10L - 4L = 6L Value Calculate new values on rebalancing date Calculate new value of equity and debt using the info given in ques. For ex: If equity Index on investment date was 20,000 and index on rebalancing date is 24,000. Then New value of equity = (4L / 20,000) × 24,000 = ₹4,80,000 VA = (VP - VFI0or) × Multiplier = (10.8L - 8L) × 2 = 56L VC = Balance amount = VP - VA = 10.8L - 5.6L = 5.2L VC = Balance amount = VP - VA = 10.8L - 5.6L = 5.2L Multiplier In floor value % is not directly given in ques, then you can calculate it as: Current value - Minimum value (as given in ques) × 100				
conservative securities (debt or risk-free securities). Ex: Total amount to be invested (VP) = ₹10L. Floor value of investor (Vfloor) = ₹8L. Multiplier (for aggressive securities) = 2 Ans: Step 1: Calculate the opening values Amount in Aggressive securities (equity) VA = (VP - VFloor) × Multiplier = (10L - 8L) × 2 = 4L Amount in Conservative securities (debt) Vc = Balance amount = VP - VA = 10L - 4L = 6L Step 2: Calculate new values on rebalancing date Calculate new value of equity and debt using the info given in ques. For ex: If equity Index on investment date was 20,000 and index on rebalancing date is 24,000. Then New value of equity = (4L / 20,000) × 24,000 = ₹4,80,000 Step 3: Rebalancing portfolio (same as step 1) New VP = VA + VC = 4,8L + 6L = 10.8L VA = (VP - Vfloor) × Multiplier = (10.8L - 8L) × 2 = 5.6L VC = Balance amount = VP - VA = 10.8L - 5.6L = 5.2L Hence, sell ₹80,000 (6L - 5.2L) of conservative securities and buy ₹80,000 worth of equity. NOTES: 1 If floor value % is not directly given in ques, then you can calculate it as: Current value - Minimum value (as given in ques) × 100				
 Ex: Total amount to be invested (VP) = ₹10L. Floor value of investor (Vrioor) = ₹8L. Multiplier (for aggressive securities) = 2 Ans: Step 1: Calculate the opening values Amount in Aggressive securities (equity) VA = (VP - Vrioor) × Multiplier = (10L - 8L) × 2 = 4L Amount in Conservative securities (debt) Vc = Balance amount = VP - VA = 10L - 4L = 6L Step 2: Calculate new values on rebalancing date Calculate new value of equity and debt using the info given in ques. For ex: If equity Index on investment date was 20,000 and index on rebalancing date is 24,000. Then New value of equity = (4L / 20,000) × 24,000 = ₹4,80,000 Step 3: Rebalancing portfolio (same as step 1) New VP = VA + VC = 4,8L + 6L = 10.8L VA = (VP - Vfloor) × Multiplier = (10.8L - 8L) × 2 = 5.6L VC = Balance amount = VP - VA = 10.8L - 5.6L = 5.2L Hence, sell ₹80,000 (6L - 5.2L) of conservative securities and buy ₹80,000 worth of equity. NOTES: 1 If floor value % is not directly given in ques, then you can calculate it as: Current value - Minimum value (as given in ques) × 100 				
Floor value of investor (Vficor) = ₹8L. Multiplier (for aggressive securities) = 2 Ans: Step 1: Calculate the opening values Amount in Aggressive securities (equity) VA = (VP - VFIcor) × Multiplier = (10L - 8L) × 2 = 4L Amount in Conservative securities (debt) Vc = Balance amount = VP - VA = 10L - 4L = 6L Step 2: Calculate new values on rebalancing date Calculate new value of equity and debt using the info given in ques. For ex: If equity Index on investment date was 20,000 and index on rebalancing date is 24,000. Then New value of equity = (4L / 20,000) × 24,000 = ₹4,80,000 Step 3: Rebalancing portfolio (same as step 1) New VP = VA + VC = 4,8L + 6L = 10.8L VA = (VP - Vfloor) × Multiplier = (10.8L - 8L) × 2 = 5.6L VC = Balance amount = VP - VA = 10.8L - 5.6L = 5.2L Hence, sell ₹80,000 (6L - 5.2L) of conservative securities and buy ₹80,000 worth of equity. NOTES: If floor value % is not directly given in ques, then you can calculate it as: Current value - Minimum value (as given in ques) × 100				
Multiplier (for aggressive securities) = 2 Ans: Step 1: Calculate the opening values Amount in Aggressive securities (equity) VA = (VP - VFloor) × Multiplier = (10L - 8L) × 2 = 4L Amount in Conservative securities (debt) Vc = Balance amount = VP - VA = 10L - 4L = 6L Step 2: Calculate new values on rebalancing date Calculate new value of equity and debt using the info given in ques. For ex: If equity Index on investment date was 20,000 and index on rebalancing date is 24,000. Then New value of equity = (4L / 20,000) × 24,000 = ₹4,80,000 Step 3: Rebalancing portfolio (same as step 1) • New VP = VA + VC • = 4,8L + 6L = 10.8L VA = (VP - Vfloor) × Multiplier = (10.8L - 8L) × 2 = 5.6L VC = Balance amount = VP - VA = 10.8L - 5.6L = 5.2L Hence, sell ₹80,000 (6L - 5.2L) of conservative securities and buy ₹80,000 worth of equity. NOTES: 1 If floor value % is not directly given in ques, then you can calculate it as: Current value - Minimum value (as given in ques) × 100				
Ans:Step 1: Calculate the opening valuesAmount in Aggressive securities (equity) $V_A = (V_P - V_{Floor}) \times Multiplier = (10L - 8L) \times 2 = 4L$ Amount in Conservative securities (debt) $V_C = Balance amount = V_P - V_A = 10L - 4L = 6L$ Step 2:Calculate new values on rebalancing dateCalculate new value of equity and debt using the info given in ques.For ex: If equity Index on investment date was 20,000 and index on rebalancing date is 24,000.Then New value of equity = (4L / 20,000) × 24,000 = ₹4,80,000Step 3:Rebalancing portfolio (same as step 1)New $V_P = VA + VC$ $VA = (VP - Vfloor) \times Multiplier$ $VA = (VP - Vfloor) \times Multiplier$ $VA = (VP - Vfloor) \times Multiplier$ $VA = 10.8L - 5.6L$ $VC = Balance amount = VP - VA$ $VA = (VP - Vfloor) \times Multiplier$ $VA = 10.8L - 5.6L = 5.2L$ $VC = Balance amount = VP - VA$ $VA = (VP - Vfloor) \times Multiplier$ $VA = (VP - MA) = 10.8L - 5.6L = 5.2L$ $VC = Balance amount = VP - VA$ $VA = (VP - Vfloor) \times Multiplier$ $VA = (VP - MA) = 10.8L - 5.6L = 5.2L$ $VE = Balance amount = VP - VA$ $VE = Balance amount =$				
Amount in Aggressive securities (equity) VA = (VP - Vrioor) × Multiplier = (10L - 8L) × 2 = 4L Amount in Conservative securities (debt) Vc = Balance amount = VP - VA = 10L - 4L = 6L Step 2: Calculate new values on rebalancing date Calculate new value of equity and debt using the info given in ques. For ex: If equity Index on investment date was 20,000 and index on rebalancing date is 24,000. Then New value of equity = (4L / 20,000) × 24,000 = ₹4,80,000 Step 3: Rebalancing portfolio (same as step 1) New VP = VA + VC = 4.8L + 6L = 10.8L VA = (VP - Vfloor) × Multiplier = (10.8L - 8L) × 2 = 5.6L VC = Balance amount = VP - VA = 10.8L - 5.6L = 5.2L Hence, sell ₹80,000 (6L - 5.2L) of conservative securities and buy ₹80,000 worth of equity. NOTES: 1 If floor value % is not directly given in ques, then you can calculate it as: Current value - Minimum value (as given in ques) × 100				
Amount in Conservative securities (debt) Vc = Balance amount = VP - VA = 10L - 4L = 6L Step 2: Calculate new values on rebalancing date Calculate new value of equity and debt using the info given in ques. For ex: If equity Index on investment date was 20,000 and index on rebalancing date is 24,000. Then New value of equity = (4L / 20,000) × 24,000 = ₹4,80,000 Step 3: Rebalancing portfolio (same as step 1) New VP = VA + VC = 4,8L + 6L = 10.8L VA = (VP - Vfloor) × Multiplier = (10.8L - 8L) × 2 = 5.6L VC = Balance amount = VP - VA = 10.8L - 5.2L Hence, sell ₹80,000 (6L - 5.2L) of conservative securities and buy ₹80,000 worth of equity. NOTES: If floor value % is not directly given in ques, then you can calculate it as: Current value - Minimum value (as given in ques) × 100				
Step 2: Calculate new values on rebalancing date Calculate new value of equity and debt using the info given in ques. For ex: If equity Index on investment date was 20,000 and index on rebalancing date is 24,000. Then New value of equity = (4L / 20,000) × 24,000 = ₹4,80,000 Step 3: Rebalancing portfolio (same as step 1) New Vp = VA + VC = 4,8L + 6L = 10.8L VA = (VP - Vfloor) × Multiplier = (10.8L - 8L) × 2 = 5.6L VC = Balance amount = VP - VA = 10.8L - 5.6L = 5.2L Hence, sell ₹80,000 (6L - 5.2L) of conservative securities and buy ₹80,000 worth of equity. NOTES: 1 If floor value % is not directly given in ques, then you can calculate it as: Current value - Minimum value (as given in ques) × 100				
Calculate new value of equity and debt using the info given in ques. For ex: If equity Index on investment date was 20,000 and index on rebalancing date is 24,000. Then New value of equity = (4L / 20,000) × 24,000 = ₹4,80,000 Step 3: Rebalancing portfolio (same as step 1) • New VP = VA + VC • = 4.8L + 6L = 10.8L VA = (VP - Vfloor) × Multiplier = (10.8L - 8L) × 2 = 5.6L VC = Balance amount = VP - VA = 10.8L - 5.6L = 5.2L Hence, sell ₹80,000 (6L - 5.2L) of conservative securities and buy ₹80,000 worth of equity. NOTES: 1 If floor value % is not directly given in ques, then you can calculate it as: Current value - Minimum value (as given in ques) × 100				
For ex: If equity Index on investment date was 20,000 and index on rebalancing date is 24,000. Then New value of equity = (4L / 20,000) × 24,000 = ₹4,80,000 Step 3: Rebalancing portfolio (same as step 1) • New VP = VA + VC = 4.8L + 6L = 10.8L VA = (VP - Vfloor) × Multiplier = (10.8L - 8L) × 2 = 5.6L VC = Balance amount = VP - VA = 10.8L - 5.6L = 5.2L Hence, sell ₹80,000 (6L - 5.2L) of conservative securities and buy ₹80,000 worth of equity. NOTES: 1 If floor value % is not directly given in ques, then you can calculate it as: Current value - Minimum value (as given in ques) × 100				
Then New value of equity = (4L / 20,000) × 24,000 = ₹4,80,000 Step 3: Rebalancing portfolio (same as step 1) • New VP = VA + VC = 4.8L + 6L = 10.8L VA = (VP - Vfloor) × Multiplier = (10.8L - 8L) × 2 = 5.6L VC = Balance amount = VP - VA = 10.8L - 5.6L = 5.2L Hence, sell ₹80,000 (6L - 5.2L) of conservative securities and buy ₹80,000 worth of equity. Image: NOTES: 1. If floor value % is not directly given in ques, then you can calculate it as: Current value - Minimum value (as given in ques) × 100				
Step 3: Rebalancing portfolio (same as step 1) • New VP = VA + VC = 4.8L + 6L = 10.8L VA = (VP - Vfloor) × Multiplier = (10.8L - 8L) × 2 = 5.6L VC = Balance amount = VP - VA = 10.8L - 5.6L = 5.2L Hence, sell ₹80,000 (6L - 5.2L) of conservative securities and buy ₹80,000 worth of equity. NOTES: 1 If floor value % is not directly given in ques, then you can calculate it as: Current value - Minimum value (as given in ques) × 100				
 New VP = VA + VC = 4.8L + 6L = 10.8L VA = (VP - Vfloor) × Multiplier = (10.8L - 8L) × 2 = 5.6L VC = Balance amount = VP - VA = 10.8L - 5.6L = 5.2L Hence, sell ₹80,000 (6L - 5.2L) of conservative securities and buy ₹80,000 worth of equity. NOTES: If floor value % is not directly given in ques, then you can calculate it as: Current value - Minimum value (as given in ques) × 100 				
VA = (VP - Vfloor) × Multiplier = (10.8L - 8L) × 2 = 5.6L VC = Balance amount = VP - VA = 10.8L - 5.6L = 5.2L Hence, sell ₹80,000 (6L - 5.2L) of conservative securities and buy ₹80,000 worth of equity. NOTES: 1. If floor value % is not directly given in ques, then you can calculate it as: Current value - Minimum value (as given in ques) × 100				
VC = Balance amount = VP - VA = 10.8L - 5.6L = 5.2L Hence, sell ₹80,000 (6L - 5.2L) of conservative securities and buy ₹80,000 worth of equity. NOTES: 1. If floor value % is not directly given in ques, then you can calculate it as: Current value - Minimum value (as given in ques) × 100				
Hence, sell ₹80,000 (6L - 5.2L) of conservative securities and buy ₹80,000 worth of equity. NOTES: 1. If floor value % is not directly given in ques, then you can calculate it as: Current value - Minimum value (as given in ques) × 100				
NOTES: 1. If floor value % is not directly given in ques, then you can calculate it as: <u>Current value — Minimum value (as given in ques)</u> × 100				
1. If floor value % is not directly given in ques, then you can calculate it as: <u>Current value — Minimum value (as given in ques)</u> × 100				
<u>Current value — Minimum value (as given in ques)</u> x 100				
Current value				
TYPE 4 - BUY AND HOLD POLICY OR DO-NOTHING POLICY				
(Easiest) Closing value of portfolio = Number of shares (or units) × Closing value per share (or unit				

3.	Sharpe's Optima	l portfolio			(43)				
	(Complete video is availa	•	ırch 'Krivi Edu	uspace sharpe optimal	portfolio')				
Step 1:	Rank the securities based	l on Treynor ratio (recall Treyno	r ratio = <u>Rp — R</u> F)					
				β_P					
Step 2:	Calculate Ci and decide c	ut-off							
	Ci = <u>om² × ∑</u> (Treynor rati	0 × A)							
	$1 + (\sigma m^2 \times \Sigma A)$								
	where A = β^2 / σ_e^2								
Step 3:	Cut off point is the high	nest value of Ci and	is represent	ed by C*.					
	Stocks which have Treyr	Or ratiO greater th	an C* are sel	ected.					
Step 4:	Deciding weights								
	Weight = <u>Zi</u> Where Zi =	$\beta/\sigma_e^2 \times (\text{Treynor})$	ratio — C*)						
	ΣZ_i								
4.	Corner Theorem				(44)				
	Concept — Portfolios on minimum variance set have LINEAR RELATION BETWEEN THEM.								
				Two portfolio — Portfolio X and Portfolio Y lies on minimum variance set.					
Ex:	Two portfolio — Portfol	io X and Portfolio X	lies on mini	num variance set.					
Ex:	Two portfolio — Portfol	io X and Portfolio X Weigh		mum variance set. Weight B	Weight C				
Ex:	Two portfolio — Portfol Portfolio X	Weigh			Weight C 0.30				
Ex:		Weigh 0	ŧΑ	Weight B	3				
Ex:	Portfolio X	Weigh 0 0	t A .20 .30	Weight B 0.50 0.30	0.30 0.40				
Ex:	Portfolio X Portfolio Y	Weigh 0 0 Iso on minimum var	t A .20 .30 'iance set. W	Weight B 0.50 0.30 eight of stock A (Wa)	0.30 0.40 in portfolio Z is 0.				
Ex:	Portfolio X Portfolio Y Another Portfolio Z is a	Weigh 0 0 Iso on minimum var	t A .20 .30 'iance set. W	Weight B 0.50 0.30 eight of stock A (Wa)	0.30 0.40 in portfolio Z is 0.				
	Portfolio X Portfolio Y Another Portfolio Z is a Determine the weight o	Weigh 0 1 1so on minimum var f Stock B (Wb) & We	t A .20 .30 :iance set. W eight of C (N	Weight B 0.50 0.30 eight of stock A (Wa) Ic). No restrictions on	0.30 0.40 in portfolio Z is 0.1				
	Portfolio X Portfolio Y Another Portfolio Z is a Determine the weight o <u>Method 1 — Intuitive</u>	Weigh 0 1so on minimum var f Stock B (Wb) & We 1 -> Wb decreased k	t A .20 .30 :iance set. W eight of C (N by 0.2 & Wc i	Weight B 0.50 0.30 eight of stock A (Wa) Ic). No restrictions on ncreased by 0.1.	0.30 0.40 in portfolio Z is 0.				
	Portfolio X Portfolio Y Another Portfolio Z is a Determine the weight o <u>Method 1 — Intuitive</u> When Wa increased by 0	Weigh 0 lso on minimum var f Stock B (Wb) & We 1 -> Wb decreased k creases by 0.3 (ie. Ne	t A .20 .30 :iance set. We eight of C (N by 0.2 & Wc i	Weight B 0.50 0.30 eight of stock A (Wa) Ic). No restrictions on ncreased by 0.1. D.2 + 0.3 = 0.5), then	0.30 0.40 in portfolio Z is 0.				
	Portfolio X Portfolio Y Another Portfolio Z is a Determine the weight o <u>Method 1 — Intuitive</u> When Wa increased by 0 Hence, if weight of A inc	Weigh 0 lso on minimum var f Stock B (Wb) & We 1 -> Wb decreased k creases by 0.3 (ie. Ne	t A .20 .30 :iance set. We eight of C (N by 0.2 & Wc i ew weight = (Il increase by	Weight B 0.50 0.30 eight of stock A (Wa) Ic). No restrictions on ncreased by 0.1. D.2 + 0.3 = 0.5), then	0.30 0.40 in portfolio Z is 0.				

	Method 2 - Mathematically (in terms of linear equations)
	Since there is a linear relation between weights of different stocks, so we can use linear equation
	line -> y = a + bx (where m = slope and C = intercept)
	Wb = a + b.Wa
i.	0.5 = a + 0.2b
ii.	0.3 = a + 0.3b
	Subtracting ii from i
	0.2 = -0.1b
	b = -2
	Putting value of a in equation i
	$0.5 = a + (-2 \times 0.2)$ => $a = 0.9$
	Conception of exiting line becomen
	Equation of critical line becomes: Wb = 0.9 - 2Wa
->	So, if Wa = 0.5, then Wb will be:
	$Wb = 0.9 - 2 \times 0.5 = -0.1$
	Wa + Wb + Wc = 1
	$0.5 + (-0.1) + Wc = 1 \implies Wc = 0.6$

Chapter 8 **Mutual Funds Chapter Index** Part A – Basics of Mutual Fund Part B - Advanced Topics ---- Student's Space for Summary chart and notes ----

PART A: Basics of Mutual fund

1.	Introduction					
	- Mutual means 'common'. Mutual fund means a common fund in which a large number of people					
	money. This money is then invested in stocks, bonds etc.					
	Investors in mutual fund are allotted 'UNITS' (just like investors of a company are allotted shares).					
_	UNITS CAN BE ISSUED IN FRACTIONS (UNLIKE SHARES). TAKE UNITS IN 2 DECIMALS. Likewise, Investors who invests in mutual fund are known as 'Unit-holders'.					
II)	MECHANISM OF MUTUAL FUND (MF)					
	Step 1 — Investors invests in mutual fund. Say 10 l	ac people invested ₹5,000 (on an average).				
	So, Total fund value = 10 lac x 5000 = ₹500 crores					
	Step 2 $-$ Fund invests this ₹500 crores in stocks, bonds etc. and earns a return of say 15%.					
	Gross Return earned by fund = 500 × 15% = ₹75 crores.					
	Step 3 $-$ Fund also had to incur some expenses (such as salary, rent, marketing exp etc.). Let us say that					
	total expenses during the year were ₹2 crores.					
	Step 4 — Net return earned by fund = Gross return	n (-) Expenses = 75 — 2 = ₹73 crores.				
	Net return in % = 73/500 = 14.6%					
Note:	The net return (of \gtrless 73 crores) in above example belongs to UNITHOLDERS.					
	MF may distribute these earnings to unitholders or may retain & re-invest it (just like a normal co.)					
)	ILLUSTRATIVE BALANCE SHEET OF A MUTUAL FU	ND				
	Liabilities	Assets				
	Funds contributed by unitholders xxx	Investment in shares, bonds, other financial				
	(Similar to equity — though not exactly like that)	instruments etc. xxx				
		Accrued Dividend xx				
	External liabilities	Accrued interest on bonds xx				
	Outstanding salary XXX	Cash balance xx				
	Other outstanding operational exp <u>xxx</u>	Prepaid expenses <u>xx</u>				
	Total : <u>×××</u>	Total : <u>xxx</u>				

		W.KRIVII.IN
2.	Net asset value (NAV) of MF	
	NAV is also simply called as 'Value' sometimes.	
•	NAV = <u>MV of all assets (-) MV of EXTERNAL liabilities</u> (just like net	t-worth of a co
	Number of units of Mutual fund	
•	NAV per unit = Total NAV of fund ÷ Number of units	
II)	ILLUSTRATIVE NAV CALCULATION	(1,2,5)
	Market Value of shares, bonds and other investment x:	xx
	Accrued interest or Dividend (on bonds etc.) x:	xx
	Closing Cash balance (discussed below in detail) x:	xx
	Other assets x	xx
(-)	External liabilities:	
	Outstanding salaries (*	(xx)
	Other outstanding expenses / payables etc. (*	(xx)
=>	NAV = A - B (Total assets - Total external liabilities) xx	××
III)	NOTES	
1.	Take Book value if Market Value is not available.	
2.	Only unpaid liabilities are deducted while calculating NAV. Ex: Salary if unpaid is a liability a	ind hence must
	be deducted. But salary if already paid is no longer a liability (it is an expense). Don't dec	luct again.
3.	NAV is updated on daily basis (as price of shares, bonds etc. held as investment by MF ke	eps on changing
4.	An investor can buy or sell units of MF at the prevailing NAV (\pm entry or exit load — dis	scussed later)
IV)	CALCULATION OF CLOSING CASH BALANCE	(6,7a&b
	Opening cash balance	xxx
+	New units issued (net of floatation cost)	xxx
+	Sale of securities	xxx
+	Dividend / Interest received on investment	xxx
	Purchase of securities	(xxx)
(-)		.c.) (xxx)
(-) (-)	Income distributed to unitholders (this can be dividend distribution or CG distribution et	
	Income distributed to unitholders (this can be dividend distribution or CG distribution et Management and other expenses paid	<u>(xxx)</u>

Mutual Fund Finance Acharya Jatin Nagpal (CA, FRM) 8.4 **Expenses** 3. I) UNITS CAN BE ISSUED IN FRACTIONS Ex: NAV of Dtek MF = ₹40.7. Calculate number of units allotted if an investor invests ₹50,000 in this fund. AUTHOR NOTE - ALWAYS TAKE UNITS IN 2 DECIMALS. A: Number of units = 5,000/40.7 = 122.85 units. II) EXPENSE RATIO or MANAGEMENT EXPENSE RATIO (MER) (9) Expense Ratio = Expenses Incurred (per unit) where Average NAV = Opening + Closing NAV Average NAV 2 It includes all the management & operational expenses such as management remuneration etc. _ It does not include brokerage cost for TRADING THE PORTFOLIO. III) ENTRY LOAD or FRONT-END LOAD (10) It is an additional amount charged by MF at the time of purchasing the units. Prevailing NAV + Entry load = Issue price Ex : Current NAV = ₹10. Entry load = 5% How much ₹ will an investor require to purchase 1 unit of this fund? i) How many units will be allotted if ₹10,000 is invested in such MF. ii) Ans: i) Investor will require 10 + 5% = ₹10.5 to buy one unit. 10,000/10.5 = 952.38 units. ii) IV) | EXIT LOAD or BACK-END LOAD (11) It is an amount charged by MF at the time of selling the units by investor. Prevailing NAV - Exit load = Redemption price Ex : Current NAV = ₹20. I hold 500 such units. Find my sale proceeds if company charges exit load of 5%. Amount per unit = 20 x 0.95 = ₹19 Ans : Sale proceeds = 500 × 19 = ₹9,500 **V) RELATION BETWEEN INVESTOR'S RETURN & REQUIRED RETURN FROM MF** (14a&b, 15) Return Earned by Investor + Recurring Expenses = Return on Mutual Fund 1 - Initial Expenses

tual	Fund	8.5	WV	VW.KRIVII.IN	
4.	Dividends – Received	& Paid by MF			
	A car co> Business of manufactu	uring cars ->	Earns income from sale (of cars	
	A MF -> Business of investing in	n shares, bonds etc>	i) Dividend receipt (from	invested shares)	
			ii) Interest receipt (from	invested bonds)	
			iii) Capital gain (Sale price	- Purchase price)	
II)	IMPORTANT NOTES				
1.	Do Not confuse				
	Dividends RECEIVED by MF is the 'Op	erational income' of Mu	tual fund.		
2	What about the Dividends PAID by	Mutual fund?			
	Dividend paid by MF to its unitholde	ers is often called DISTRI	BUTION. (Just like a normal	co. pays dividends	
3.	The MF may or may not distribute	its earnings (just like a n	ormal co.)	· -	
III)	ILLUSTRATIVE INCOME STATEMEI	NT OF A MF			
•	Income			₹ in crores	
i)	Dividends received from investmen	t in shares (this is operat	ional income of MF)	26	
ii)	Interest receipts (from investment	; in bonds)		42	
iii)	Capital gain from sale of shares and	d bonds		104	
iv)	Other income			3	
			A. Total income	175	
(-)	<u>Expenses</u>				
	Salaries			12	
	Other operational expenses			3	
			B. Total expenses:	<u>15</u>	
=	Net Income = $A - B$ (feel it like Ne-	t profit of a normal co.)		160	
(-)	Distribution by MF to unitholders (f	eel it like dividends paid k	ру со.)	<u>120</u>	
	Balance retained by MF			<u>40</u>	
IV)	EFFECT ON NAV WHEN DIVIDEND	IS 'RECEIVED' BY MF			
	Dividend receipt on investment is an income of mutual fund and will increase its cash balance.				
	Hence, NAV of fund will increase.				
Ex :	Kion MF has following assets and lia	bilities			
	ž	crores			

	Acharya Jatin Nagpal (CA, FRM) 8.6 Mutual F	0110			
	0/S Expenses ₹0.6 crores				
(i)	Find NAV of MF given that number of units = 2 crores				
(ii)	Find new NAV if the fund receives dividends of ₹4 crores.				
A:	i) Existing NAV = <u>(50 + 2) - 0.6</u> = 25.7				
	2				
ii)	Dividend is received by MF. It will increase its cash balance.				
	New Cash Balance = 2+4 = 6 crores				
	New NAV = $(50 + 6) - 0.6$ = 27.7				
	2				
	Alternatively, we can also above part (ii) directly as:				
	Dividend received by MF on per unit basis = 4 crores / 2 crores = ₹2 per unit				
	Hence, new NAV = 25.7 + 2 = 27.7				
V)	EFFECT ON NAV IN CASE OF 'DISTRIBUTION' BY MF (i.e. Dividend paid by MF to unitholders) (8				
V)	EFFECT ON NAV IN CASE OF DISTRIBUTION BY MF (i.e. Dividend paid by MF to unitholders)				
V)	EFFECT ON NAV IN CASE OF 'DISTRIBUTION' BY MF (i.e. Dividend paid by MF to unitholders) Distribution to unitholders will decrease the cash balance of MF. Hence, NAV of fund will fall.				
V) Ex :					
	Distribution to unitholders will decrease the cash balance of MF. Hence, NAV of fund will fall.				
	Distribution to unitholders will decrease the cash balance of MF. Hence, NAV of fund will fall. Bestie MF has following assets and liabilities :				
	Distribution to unitholders will decrease the cash balance of MF. Hence, NAV of fund will fall. Bestie MF has following assets and liabilities : Investment ₹400 crores				
	Distribution to unitholders will decrease the cash balance of MF. Hence, NAV of fund will fall. Bestie MF has following assets and liabilities : Investment ₹400 crores Cash balance ₹60 crores				
Ex :	Distribution to unitholders will decrease the cash balance of MF. Hence, NAV of fund will fall. Bestie MF has following assets and liabilities : Investment ₹400 crores Cash balance ₹60 crores External liabilities Nil				
Ex : (i)	Distribution to unitholders will decrease the cash balance of MF. Hence, NAV of fund will fall. Bestie MF has following assets and liabilities : Investment ₹400 crores Cash balance ₹60 crores External liabilities Nil Find existing NAV if number of units = 50 crores.				
Ex : (i) (ii)	Distribution to unitholders will decrease the cash balance of MF. Hence, NAV of fund will fall. Bestie MF has following assets and liabilities : Investment ₹400 crores Cash balance ₹60 crores External liabilities Nil Find existing NAV if number of units = 50 crores. Find new NAV if MF pays-out a dividend of ₹40 crores to its unitholders.				
Ex : (i) (ii) A:	Distribution to unitholders will decrease the cash balance of MF. Hence, NAV of fund will fall. Bestie MF has following assets and liabilities : Investment ₹400 crores Cash balance ₹60 crores External liabilities Nil Find existing NAV if number of units = 50 crores. Find new NAV if MF pays-out a dividend of ₹40 crores to its unitholders. i) Existing NAV = (400 + 60)/50 = 9.2				
Ex : (i) (ii) A:	Distribution to unitholders will decrease the cash balance of MF. Hence, NAV of fund will fall. Bestie MF has following assets and liabilities : Investment ₹400 crores Cash balance ₹60 crores External liabilities Nil Find existing NAV if number of units = 50 crores. Find new NAV if MF pays-out a dividend of ₹40 crores to its unitholders. i) Existing NAV = (400 + 60)/50 = 9.2 New cash balance = 60 - 40 = ₹20 crores				
Ex : (i) (ii) A:	Distribution to unitholders will decrease the cash balance of MF. Hence, NAV of fund will fall. Bestie MF has following assets and liabilities : Investment $₹400 \text{ crores}$ Cash balance $₹60 \text{ crores}$ External liabilities Nil Find existing NAV if number of units = 50 crores. Find new NAV if MF pays-out a dividend of ₹40 crores to its unitholders. i) Existing NAV = (400 + 60)/50 = 9.2 New cash balance = 60 - 40 = ₹20 crores New NAV = (400 + 20)/50 = 8.1				
Ex : (i) (ii) A:	Distribution to unitholders will decrease the cash balance of MF. Hence, NAV of fund will fall. Bestie MF has following assets and liabilities : Investment ₹400 crores Cash balance ₹60 crores External liabilities Nil Find existing NAV if number of units = 50 crores. Find new NAV if MF pays-out a dividend of ₹40 crores to its unitholders. i) Existing NAV = (400 + 60)/50 = 9.2 New cash balance = 60 - 40 = ₹20 crores New NAV = (400 + 20)/50 = 8.4 Alternatively, we could have calculated distribution per unit = 40/50 = 0.8				

1utual	Fund	8.7	WWW.KRIVII.IN		
	Logic - MF does not have share	eholders. (It has Unitholders).			
	Illustration — Kranti MF bought	: shares of Intel ltd. So, now Kranti	MF is a shareholder for Intel ltd.		
	So now if Intel pays any divider	nd, then Kranti MF will receive it (ju:	ist like other shareholders.)		
5.	Return and Fees of	Mutual fund			
I)	RETURN CALCULATION		(3,4,12,13)		
1.	Holding period return (HPR) = <u>(N</u> /	AV1 — NAV0) + Income distributed			
		NAV ₀			
	Income distributed can be Capi	ital gain distribution or Dividend/Int	erest distribution.		
2.	Annual return or Effective yield	d p.a. = HPR × 12 / 365			
		No. of days / m	nonth		
II)	TRACKING ERROR (TE)				
	Tracking error refer to the deviation of fund's return from the benchmark return.				
	Some reasons for TE include: Transaction cost, fees charged by AMCs, fund expenses, cash holding etc.				
	Tracking error = $\int \sum (d - \overline{d})$				
	√ n - 1				
	where: d = differential return	n (i.e. Benchmark return — Actual re	aturn of fund		
	\bar{d} = Average of diffe				
	n = number of obser				
III)	MANAGEMENT FEES				
	There are generally two types o	of fees charged by a fund.			
	Fixed management fees — Thes	e must be paid in all the circumstar	nces.		
	Incentive fees — It is paid only	y when fund value crosses a defined	l benchmark.		

Τ

8.8

Mutual Fund

1.	Different types of plans (v.imp) (23,24,2			
I)	DIVIDEND PAY-OUT PLAN			
	The dividend is paid to unitholders in cash. Since cash is paid out -> NAV per unit falls.			
II)	DI VIDEND RE-INVESTMENT PLAN (16a&			
	Dividend is declared as usual . But instead of paying it in cash, new units are issued to unitholders at			
	existing NAV ie. at ex-dividend NAV.			
	Number of new units issued = <u>Number of units held x Dividend per unit</u>			
	Ex-dividend NAV per unit			
III)	GROWTH PLAN			
	No dividend is paid whatsoever. Since, no cash is paid as dividend, NAV of fund keeps on increasing.			
Ex:	Opening NAV = ₹40. During the year fund earned ₹8 per unit . Closing NAV = 40+8 = ₹48.			
IV)	BONUS PLAN			
	No dividends are paid whatsoever. However Bonus units are issued from time to time .			
Ex:				
	Bonus units = $50,000 \times \frac{1}{4}$ = 12500. New total units = $50,000 + 12,500 = 62,500$			
	or directly -> New units = 50,000 x 5/4 = 62,500			
2.	Dividend Equalisation Reserve (22)			
I)	CONCEPT			
	MF earns income throughout the year but distributes it at the end of the year.			

100000	Fund	8.9		WWW.KRIVII.IN		
-	NEW INVESTOR JOINS THE FUND					
	He must bring his share of income at the	time of entering.				
	Purchase price = Opening NAV + Bring in yo	our share of incom	e			
-	This share of income is known as EQUALIS					
-	All this undistributed income is handled via					
-	When a new investor brings in Equalisation			-> ADD it to DER A/c		
-	When an existing investor exits & takes av	way his share of eq	ualisation amount	-> REDUCE it from DER.		
-	If Entry or exit load is given -> Then calcu	ulate it on Opening	NAV (without consid	lering DER amount).		
Ex:	NAV of Union MF on 1 st May was ₹15 per ur	nit. Total number of	units = 10 crores. Th	ne fund earned an incom		
	of ₹40 crores in April and ₹25 crores during May. I want to sell my units on 31 May.					
i)	What price should I get if: C	ase a $-$ Exit load is	0			
	С	ase b - Exit load is	2%.			
ii)	Also, calculate the Dividend equalisation reserve amount on total and per unit basis if total of 10 lacs unit					
	were re-purchased (redeemed) on 31 May.

Chapter 9A Derivatives – Futures

Chapter Index

PART A - Basics of Futures

PART B – Pricing Futures

PART C - Arbitrage, Speculation & Hedging

---- Student's Space for Summary chart and notes ----

2.	2. FUTURES - Basics					
	A futures contract is a contract to buy/sell an item at a future date.					
	TODAY - Price, quantity and other contractual terms are fixed today only.					
	ON SETTLEMENT DATE - The contract can be settled	either by way of:				
	Net settlement or Physical delivery.					
	Illus: You owe me ₹1000 and I owe you ₹200.					
	Net settlement	Physical delivery				
-	You pay me ₹ 800 only (net balance)	I pay you ₹200 & you pay me ₹1000				
-	For detailed illustration on net settlement, refer	For a detailed illustration on physical delivery, refe				
	'Fin Fundas — I love You betting'.	'Fin Fundas — Wheat farmer case'				
II)	DIFFERENCE BETWEEN SPOT DELIVERY & FORWAR	2D				
	SPOT CONTRACT a.k.a CASH MARKET	FUTURES CONTRACT				
i.	A contract to buy/sell an item is entered today.	A contract to buy/sell an item is entered today.				
ii.	Price is fixed today.	Price is fixed today.				
iii.	Quantity is decided today.	Quantity is decided today.				
iv.	Delivery is given today only (T+2)	Delivery will be given on expiry date.				
v.	Payment is made today only.	Payment will be made on the expiry date.				
III)	FUTURES BASIC TERMINOLOGY					
1.	Quantity which is decided today is known as 'Lot si					
2.	Period after which delivery will be made is known as					
3.	Price that is fixed today is known as the 'Price of f	futures contract'				
IV)	FOR BEST UNDERSTANDING OF FUTURES					
	Think of Futures as Betting -> सट्टेबाज़ी					
	Imagine that in the end everything will be settled c	n net basis.				
	Long futures (F+) -> Upside betting (profit if price i	ncreases).				
	Short futures (F-) -> Downside betting (profit if price fall)					

	Acharya Jatin Nagpal (CA, FRM) 9A.4 Derivatives (Futures
3.	Mechanics of Futures
I)	TYPES OF FUTURES CONTRACT
	Futures contract is just a form of betting and we can bet on a lot of different items. It can be:
	Stock futures, Index futures, currency futures, commodity futures etc.
II)	LOTS – IN CASE OF FUTURES CONTRACT
	In stock market (i.e. cash market), you can even purchase a single share. But in case of futures market,
	one must deal in lots. (Lot size is decided by stock exchange).
Ex:	One lot of Nifty = 75, One lot of Reliance Itd = 500.
4.	Squaring Off / Settling / Closing Futures Position (1,3)
	Squaring off futures is same as squaring off a stock position.
	If Bought shares (S ⁺) -> Then sell shares (S ⁻) to square off
	If Sold shares (S ⁻) -> Then buy shares (S ⁺) to square off.
	Similarly, while trading futures:
	If bought futures (F*) -> Then sell futures (F ⁻) to square off.
	If Sold futures (F–) -> Then long futures (F+) to square off.
Ex:	Mr. Abc bought a futures contract at ₹425. Find his gain / (loss) if he later squares off his position at
	₹435. Lot size = 500 shares.
A:	Bought future at ₹425
	Sold future at ₹435
	Gain / (loss) per share ₹10
	Total Gain = ₹10 x 500 = ₹5,000
5.	Margin requirements (6a, 6b)
	(Refer Fin Fundas — I Love you Betting)
1.	INITIAL MARGIN
	- It is like a security deposit that must be deposited before entering into futures contract.
	- Both the parties - long futures & short futures must deposit this margin money.
	- This margin money is refunded at the time of closing of position (after adjusting for P&L).

2.	If Initial Margin is not a	given in ques, then	calculate it as	: -> Initial Marg	in = μ + 3σ	
	where: µ = Daily absolu	<u> </u>		ard deviation		
		5				
3.	Mark to market (MTM)					
-	Think of it like a profit/	/loss account. Refe	r example belo	ow for better (understanding.	
-	If MTM balance > initial	margin level, then	investor can w	vithdraw the a	dditional amou	nt.
	In exam -> Do NOT wit	hdraw this amoun	t unless specifi	cally mentioned	d in ques.	
4.	MAINTENANCE MARGIN					
	If balance in margin acc	count falls below r	naintenance m	argin, then the	balance in mar	gin account must be
	brought back to initial	margin level (by de	positing more	money).

PART B: Pricing Futures

1.	Pricing a Futures contract			
I)	INTRODUCTION			
	Pricing of Derivatives is done using 'Principal of N	No Arbitrage' (refer annexure Section 3 for more		
	Principal of No arbitrage (also known as	Law of one price) says:		
	'Two bundle of assets with same underly	ing cash flows shall have same price'.		
Illus:	Mr. Manager will receive bonus after 3 months. He is	optimistic about 'RIL' shares which are currently		
	trading at ₹2000. But he don't want to wait for ne	xt 3 months as he is afraid that price will rise by the		
	time.			
	He has to	vo options:		
	OPTION 1 - Borrow & Buy	OPTION 2 — Buy futures		
-	Borrow ₹2000 today for a period of 3 months.	Enter into a futures contract to buy		
	(Interest rate = 6% p.a.)	Reliance shares after 3 months.		
-	Use this borrowed amount to buy Reliance shares			
	today only at ₹2000.	As per Principal of No Arbitrage, the cost of		
		these 2 alternatives must be same.		
-	Repay loan after 3 months (i.e. when bonus is	∴ Futures price = ₹2030.		
	received). Amount to be repaid:			
	2000 × (1 + 0.06×3/12) = ₹2030			
Ē	We can say that PRICE OF FUTURES CONTACT ,	also known as FAIR FUTURES PRICE (FFP) is -		
	FFP = SR (1 + rt)	(simple interest)		
	or FFP = SR $(1 + r)^n$	(compound interest)		
	or FFP = SR e ^{rt}	(continuous compounding)		
	Hence, FFP = SR + Cost of carry			
	This is known as 'Cost of carry model'.			

Finance	Acharya Jatin Nagpal (CA, FRM)	9A.8	Derivatives (Futures)		
II)	ASSUME 'SIMPLE INTEREST RATE' UNLESS SPECIFICALLY MENTIONED IN QUES.				
	Ques specifically mention 'continuously compounded (cc)' or or give value of 'e' $ ightarrow$ CC rate				
	Ques mentions 'compounded annually or month	lly etc.' 子 Compou	and interest		
	If nothing is specifically mentioned $ ightarrow$ Assume .	simple interest			
)	SOLVING e ^o ON CALCULATOR

	Step 1: Divide power of e with ' <u>4096'</u> .				
	Step 2: Add '1'.				
	Step 3: Press 'x =' 12 times on calculator				
	Alternate 2 (bit lengthy)				
	Step 1: Enter '2.71828' and press ' $$ ' button 12 t	limes			
	Step 2: Subtract '1'				
	Step 3: Multiply with power				
	Step 4: Add 1				
	Step 5: Press 'x =' 12 times on calculator				
		-			
IV)	COST OF CARRY MODEL FOR PRICING FUTURE	5			
	O				
	Spot price		Futures price		
	Cc	Ost of Carry			
	'Cost of Carry' model for pricing Futures				
»	Cost of carry may include:				
	Add: Interest cost (it is always incurred)				
	Add: Storage cost (incurred only in case of commodities such as stell, oil etc. which needs to be stored)				
	Less: Any income received (such as dividend in case of dividend paying stock)				
	Less: Convenience yield (in case of commodities)	· · · · ·	- · ·		
	We shall discuss these all one by one.				
	The origin discuss triese un one by one.				
	<u>I</u>				

9A.9

V)	PRACTICE EXAMPLE (BASIC)			
Ex:	Calculate fair futures price (FFP) if:			
Eg:	(Simple interest) SR = ₹250, rf = 4% p.a., period = 3-m	ionth.		
Ans:	: FFP = SR (1 + rt) = 250 × (1 + 0.04 × 3/12) = ₹252.5			
Eg:	(Compound interest) SR = 850, rf = 5% p.a. compound	ded annually, period = 1 month.		
Ans:	Futures price = SR (1+r) ⁿ			
	= 850 × (1+0.05) ^{1/12} = 850 × 1.004074	= ₹ 853.463		
Eg:	(Continuous compounding) SR = ₹250, rf = 4% contin	uously compounded, period = 3-months.		
Ans:	Futures price = SR x e ^{rt}			
	$= 250 \times e^{0.04 \times 3/12} = 250 \times 1.0100$	50167 = ₹252.5125

Ex :	A stock is currently trading at ₹150. Find 3-months futures price on the stock in the following cases:		
i.	A dividend of ₹4 will be received today. Rf = 5% p.a.c.c		
ii.	A dividend of ₹5 will be received after 1 month. Rf = 5% p.a.c.c.		
iii.	Dividend of ₹2 will be received after 1-month, another ₹4 will be received after 2 months. Rf = 5% p.a.c.		
iv.	Dividend yield on stock = 3% p.a.c.c. Rf = 5% p.a.c.c.		
A:	Futures price = SR + Interest — FV of dividend		
i.	Futures price = 150 × e ^{0.05×3/12} — (4 × e ^{0.05×3/12})		
	= 151.8868 — 4.0503		
	= 147.8365		
	or alternatively, directly we can do -		
	Futures price = (150 - 4) $\times e^{0.05 \times 3/12}$		
	= 146 × 1.01258		
	= 147.836		
ii.	Futures price = 150e ^{0.05×3/12} - 5e ^{0.05×2/12}		
	= 151.8868 — 5.0418		
	= 146.845		
iii.	FV of dividends = $2e^{0.05 \times 2/12} + 4e^{0.05 \times 1/12}$		
	= 2.0167 + 4.0167 = 6.0334		
	Futures price = 150 x e ^{0.05×3/12} - 6.0334		
	= 151.8868 — 6.0334		
	= 145.853		
iv.	Futures price = 150 $e^{(0.05 - 0.03) \times 3/12}$		
	$= 150 e^{0.02 \times 3/12}$		
	= 150 × 1.005		
	= 150.75		

.

4.	FFP – When Convenience Yield (CY) is given (in case of commodities)
	Benefits in case of stocks = Dividend yield
	Benefits in case of commodity = Convenience yield (cy)
	The treatment is quite similar as well.
	What is Convenience yield?
	Having physical possession of an asset might provide some convenience (imagine — benefit) which is not
	available if you merely hold a futures contract on that asset. This convenience is denoted by convenience
	yield (CY).
F	FFP = SR + Interest - Future Value (FV) of Convenience yield
Ex:	Gold Spot is trading at ₹52,000. Find Gold 3-month futures price if Storage cost of ₹1500 will be incurred
	at the time of storage. If Gold futures are trading at ₹53,631, find convenience yield. Rf = 4% p.a.
Ans:	Futures price = (SR + PV of storage cost $-$ PV of convenience yield) (1 + r) ⁿ
	53631 = (52000 + 1500 - CY) (1 + 0.04 × 3/12)
	53100 = 53500 — CY
	CY = ₹400
5.	When Storage cost / Income (or CY etc.) is given in % (5)
	(ex: Dividend yield % given, or convenience yield % given).
	CONCEPT: Add Storage cost (sc) % to the Rf %.
	Reduce income (y) % or convenience yield % from Rf %.
-	Simple interest: FR = SR [1 + (r + sc - y)t]
-	Compound interest: FR = SR [1 + (r + sc -y)] ⁿ
-	Continuously compounded: FR = SR e ^{(r + sc -y)t}
IMP!	Income yield (y) can only be reduced from Rf if 'COMPOUNDING FREQUENCY OF BOTH RF & Y IS SAME'
	If compounding frequency is not same, then 1 st calculate income in \gtrless and then subtract its FV.
	Similarly, storage cost can be added to rf % if compounding frequency of the both are same.
	If not same, then first calculate storage cost in amount, and then add its FV.

6.	Summary			
	From above understanding, we can now s	ay:		
	FR = SR + INTEREST + FV OF STORAGE	COST (-) FV OF	ANY INCOME (-) FV	OF CONVENIENCE YIELD
	Spot Rate	Cost of Car	rry	→ Futures Rate
	4		\mathcal{F}	
	All expenses ind	curred	<u>All Benefil</u>	<u>is received</u>
	- Interest cost		——— – Dividend	
	– Storage cost		- convenier	nce yield
	This is kr	nown as 'cost of	carry model'.	
•	COST OF CARRY INCLUDES:			
	Interest cost (it is always incurred)			
+	Storage cost (incurred only in case of co	mmodities such	as stell, oil etc. which r	needs to be stored)
(-)	Any income received during the period (e:	x: dividend)		
(-)	Less: Convenience yield			
Note:	CALCULATING COST OF CARRY WHEN F	R & SR IS GIVEN		
	Futures price = SR + Cost of carry			
»	Cost of carry = Futures price — SR			
8.	Principle of Convergence			
	The principle says that on maturity: Futures price = Spot price. Reason: Futures price = SR (1+r) ⁿ At maturity, n = 0. ∴ Futures price = SR (1) = SR	y-axis = Price (₹)	\sim	Green line = Futures prio Red line = Spot price
		کمیں		
		0	x-axis = Time	Maturity Date

	P /	ART C	Arbitrage, Speculation & Hedging		
1. <mark>In</mark>	troduction to Arbi	<mark>trageurs, Specula</mark>	ators & Hedgers!		
	Arbitrageur शानी	Speculator निडर	Hedger डरपोक		
	oitrageur — Aims to earn a s	•	ther horrowd		
	Never invests even a single rupee from own pocket, but rather borrow!				
	Typical arbitrage is done by Simultaneous buying and selling to exploit price difference. Speculator (सट्टेबाज़) - Takes risk and may earn a profit if analysis is right. But may also incur loss. Hedger - Too afraid to take the risk and hence wants to transfer risk to someone else (via hedging).				
2. <mark>A</mark>	rbitrage		(16a &b , 21		
FFF	$FFP = SR (1 + r)^n$				
No	w, if actual futures price pre	evailing in the market $ eq$ Fair	futures price, then arbitrage is possible.		
I) GE	NERAL RULES FOR ARBITRA	GE			
a. Bu	y Low, Sell High - Buy cheaper	- bundle and Sell expensive b	pundle.		
b. Ne	Never Invest your own money — So, if you require funds to buy something, then BORROW AT RF.				
c. Ne	ver keep your money idle $-$ If	you have some funds, the	n always keep them invested at Rf.		
d. Am	oount of Arbitrage profit = A	mount of mispricing			
SC	ENARIO - TCS Spot rate = ₹	2000. Period = 3 months. In	terest rate = 6% p.a.		
Fai	r futures price (FFP) = 2000 ×	x (1 + 0.06 × 3/12) = ₹2030			
II) CA	SE 1 – FUTURES PRICE = ₹	2050			

	Acharya Jatin Nagpal (CA, FRM)	9A.16	Derivatives (F	0.001		
	ACTION TODAY		AFTER 3 MONTHS			
i.	Sell futures contract today at ₹2050.	i) Settle Futures	i) Settle Futures contract			
ii.	Simultaneously, borrow ₹2000 at 6%.	Sell TCS shares at	₹2050 (contracted price):	205		
iii.	Use this borrowed money to purchase the TCS	<u>ii) Settle Ioan</u> (Cas	sh outflow)			
	shares at ₹2000.	Repay loan = 2000) × (1 + 0.06×3/12) =	(203		
			Arbitrage profit =	₹20		
	CROSS-CHECK (Just for your knowledge. do not show in	exam.)				
	Arbitrage profit earned should be equal to amount	of mispricing.				
	Amount of mispricing (in futures price) = $2050 - 200$)30 = ₹20				
	Arbitrage profit earned = ₹20					
II)	CASE 2 – FUTURES PRICE = ₹2015					
	Actual futures price < FFP. Buy futures (as it is una	dervalued) and Sell st	tock (& invest sale proceeds	at Rf		
	ACTION TODAY		AFTER 3 MONTHS			
i.	Buy futures contract today at ₹2015.	i) Settle Futures	contract			
		Buy TCS shares at	t ₹2015 (contracted price):	(201		
ii.	Simultaneously, sell TCS shares at ₹2000.	ii) Investment pr	oceeds (cash inflow)			
iii.	Invest this ₹2000 at 6% p.a. for 3 months.	Investment Proc	eeds: 2000 × (1 + 0.06×3/12):	2030		
			=> Arbitrage profit =	15		
III)	PRACTICAL NOTE (Not much relevant for exam)					
	TRANSACTION COSTS MAY MAKE SMALL ARBITRAGE T	RADES UNPROFITABLE	<u>[]</u>			
Ex:	Fair futures price = ₹760. Actual futures price = ₹760.60. Transaction costs (brokerage etc.) = ₹2					
	Is Arbitrage practically viable?					
A:	Profit from arbitrage trade = Amount of mispricin	g = 760.6 — 760.0 =	0.6			
	Less: Transaction costs =		(2)			
	Net profit / (loss) =	(1.4)				
	Hence, arbitrage is not possible due to transaction	costs.				
3.	Speculator					
	Same as concept of 'Squaring off futures'. If long futures -> then short futures to square off.					
		If short futures then long futures to square off.				

WWW.KRIVII.IN

	,			
Ex:	Mr. A bought 4-months futures contract o	n TCS. Spot rate of TCS today = ₹2500. Rf = 9% p.a.		
i)	Find futures price.			
ii)	Mr. A squares off his position after 1-month, when TCS spot rate = 2600. Find Profit / loss if lot size = 800.			
iii)	Assuming that the position was not square	ed off after 1-month . But it was off at maturity ie . after		
	4- months. SR of TCS after 4-months = ₹275	50.		
A:	F = SR (1 + rf) = 2500 × (1 + 0.09 × 4/12) = ₹	£2575		
ii)	TCS Futures price after 1 month = 2600 × (1	u + 0.09 × 3/12) = ₹2658.5		
	Profit / (loss) = (2658.5 — 2575) × 800 = ₹66,8	800.		
iii)	Futures price at expiry = Spot Rate	(as per principle of convergence)		
	FP after 4-months = SR = ₹2750			
	Profit / (loss) = (2750 — 2575) × 800 = ₹1,40,0	00		
1	Ladaina maina. Chaola Futur			
4.	Hedging using Stock Futur			
	Take opposite position in futures to hedge.			
	Position in stock (aka cash market position)	Required futures position (for hedging)		
	Long	Short		
	Short	Long		
	Number of futures contracts = Number	Of shares		
		t size		
Ex:	I have 500 shares of Reliance ltd (RIL). which	is currently trading at ₹2500. A futures contract on RIL stoc		
	is trading at ₹2540. What should I do to hea	dge my stock position. Lot size of futures = 250.		
-	Show the impact of hedging if on next day	stock price fell by 2%. RIL futures price on next day = ₹2490		
A:	We must SHORT RIL futures to hedge a long	g position in the stock.		
	Number of contracts to be shorted = Nur	mber of shares = 500 = 2 contracts		
		Lot size 250		
ii)	Impact of hedging	Gain / (loss)		
ii)	Impact of hedging Loss on stock position = 500 × 2500 × 2%	Gain / (loss) (25,000)		
ii)		(25,000)

(Futures)	9A.19

III)) MODIFYING BETA USING INDEX FUTURES (9b, 4					
	In the above example we hedged the portfolio using Index futures. Alternatively, we can say that made the Beta of portfolio '0' using Index futures. We can MODIFY (I.E. INCREASE OR DECREASE) our portfolio beta using Index futures. Number to contracts to be traded = $V_h \times (T_B - C_B)$					
•						
	I _{FP} × Lot size					
	Where: V _h = Value to be hedged T _B = Target Beta					
	C _B = Current Beta I _{FP} = Index futures price					
C						
Ex:	(Continuing the same Mr. Texas example) Hedge the portfolio of Mr. Texas or alternared reduce the portfolio beta to '0'.	itively, we can say				
A:	Number to contracts to be traded = $V_h \times (T_B - C_B)$ = $20 L \times (0 - 1.5)$ =	-2 contracts				
73.	$\frac{1}{1} \frac{1}{1} \frac{1}$	(short 2 contracts)				
Note:	Minus 2 contracts means -> short 2 contracts					
Ex:	(Continuing the same Mr. Texas example) What should be done to Increase portfolio	Beta to 2.25?				
A:	Number to contracts to be traded = $V_h \times (T_B - C_B)$ = $20 L \times (2.25 - 1.5)$ =	+1 contract				
	I _{FP} × Lot size 20,000 × 75	(Long 1 contract)				
Note:	+1 contract means -> Long 1 contract.					
IV)						
	Beta of cash and risk-free assets is 'O'.					
Ex:	A portfolio of ₹50L includes equities worth ₹45L with Beta = 1.5. Balance is held as c	ash or is invested in				
	short-term risk-free securities. Nifty futures is currently trading at 10,000. Lot size = 75.					
	Type 1 - Reduce PORTFOLIO BETA to 1.2.					
A:	CAUTION. SLIP POINT -> Beta of equity = 1.5. But we have to reduce portfolio beta -	to 1.2				
	So, 1 st calculate portfolio beta = weighted average beta = 1.5 x 45/50 + 0 = 1.35					
	Number to contracts = $V_h \times (T_B - C_B)$ = $50L \times (1.2 - 1.35)$ = -1 contract					
	IFP × Lot size 10,000 × 75 i.e. short 1 contract					

	Type 2 - Reduce EQUITY BETA to 1.2.				
	We already have equity beta. So, no need to change anything here. However, beware that value of equity				
	is ₹45 lacs only. So, Value to be hedged = ₹45 Lacs (and not ₹50 lacs).				
	Number to contracts = $V_h \times (T_B - C_B)$ = $45L \times (1.2 - 1.5)$ = -1.8 or 2 approx.				
	I _{FP} × Lot size 10,000 × 75 i.e. short 2 contracts				
V)	PORTFOLIO OF EQUITY AND FUTURES (18)				
Ex:	Consider Mr. Texas portfolio of ₹20 lacs consisting of equity stocks. Beta of portfolio = 1.5				
	Calculate new beta of portfolio if Mr. Texas goes long on 1 Nifty futures contract. Value of Nifty				
	futures contract = ₹15 lacs.				
A:	Beta = Weighted average beta = <u>20L × 1.5 + 15L × 1</u> = 2.25				
	20L				
	EXPLANATION				
	Both equity position and futures position have some Beta. So, in numerator we consider both stock				
	position's beta and futures position's beta. But unlike shares, no money is required to enter into future				
	contract. Hence, in denominator the total portfolio value remains same i.e. ₹20 Lacs only.				
	contract. Hence, in denominator the total portrollo value remains sume i.e. 220 Lacs only.				
	Additional note				
	Additional note				
	<u>Additional note</u> If Beta of share or portfolio is not given in ques, then calculate it as:				
v)	<u>Additional note</u> If Beta of share or portfolio is not given in ques, then calculate it as: Beta = <u>%</u> change in value of portfolio (or stock)

9A.21 WWW.KRIVII.IN 6. Hedging in case of commodity futures (17a & b) 1) **HEDGE RATIO** Airline co. wants to hedge its oil requirements -> Buy futures (F+) Problem -> Airline requires Aviation turbine fuel (ATF). But futures are not directly available on ATF. Then what to do? Futures are available on crude oil. But oil futures & ATF Spot does not change by exactly same amount. Solution -> Know the 'Sensitivity of Spot rate w.r.t to change in Futures price.' This is given by Hedge ratio (HR) = $r_{(s,f)} \times \sigma_s$ \mathbf{Q}^{f} This is just like Beta (in case of stocks). It tells us that if FP change by 1%, then by what % will SR change. where: $r_{(s,f)}$ = correlation coefficient between spot rate and futures price σ_s = SD of Spot rate $\sigma_{\rm f}$ = SD of futures price Ex: Correlation between oil futures and Aviation turbine fuel (ATF) spot rate is 0.9. SD of oil futures = 16%. SD of ATF spot = 18%. i) Find hedge ratio. ii) Find value of oil futures to be traded if airline wants to hedge its requirement of ATF worth ₹40 crores. A: Hedge ratio (HR) = = 0.9 x 18 = 1.0125 $r_{(s,f)} \times \sigma_s$ 16 Ωť This means if oil futures price change by 1%, then spot rate is expected to change by 1.0125%. Value of oil futures = Value of spot x Hedge ratio = 40 crores x 1.0125 ₹40.5 crores. = ii) Hence, buy oil futures of ₹40.5 crores. II) | HEDGE EFFICIENCY (r square OR r^2) Hedge efficiency is given by r^2 or coefficient of determination. It tells us: "What % of variation in dependent variable is explained by variation in independent variable." Calculate and interpret hedge efficiency if correlation between oil futures & ATF is 0.9. Ex: A: Hedge efficiency = $r^2 = 0.9^2 = 0.81$ or 81%. This means that 81% of variation in ATF spot is explained by variation in oil futures price.

Balance 19% is due to some other factors.

PART D: Other Tiny Topics

1)	NET SETTLEMENT = PHYSICAL DELIVERY				
(First refer Fun Fundas — Airlines are worried)					
Ex:	Rider & Michael are two	o traders. As per Rider, price of 'Axis ban	k' will cross ₹500 in 1-month time frame		
	whereas Michael believe	s that it will fall much below ₹500. So, the	ey entered into 1-month forward contrac		
i)	Determine what position	on Rider and Michael shall take.			
ii)	Illustrate financial imp	act via 'Net settlement' if price after 1-1	month turns out to be:		
	a) 520 c) 470				
iii)	Illustrate the financial	impact If the settlement happened via '	Physical delivery' in part (ii) above.		
A:	i) Rider -> Bullish. Buy f	utures (F+) Michael -> Bearish.	Sell futures (F-)		
ii)	Gain / (loss) under 'Net settlement'				
	Price after 1 month	Gain / (loss) to Rider (F+)	Gain / (loss) to Michael (F-)		
	520	+20	-20		
	470	-30	+30		
iii)	Gain / (loss) under 'Physical delivery'				
	Rider -> Rider has bought future i.e. he has committed to buy shares at ₹500 in future.				
	On expiry, he must bu	y shares at the contractual price and can	n then sell in open market.		
	<u>Purchase price = ₹500</u>	Selling price = Prevailing market pr	rice Gain / (loss)		
	500	520	+20		
	500	470	-30		
	Michael -> Michael has sold futures i.e. he has committed to sell shares at ₹500 in future.				
	On expiry he must buy shares from open market and sell it at contractual rate of ₹500.				
	Sale price = ₹500	Purchase price = Prevailing market price	e Gain / (loss <u>)</u>		
	500	520	-20		
	500	470	+30		

	FORWARD VS FUTURES CONTRACT No difference for practical ques solving. Only Theoretical difference at your level.				
	FORWARD CONTRACT	FUTURES CONTRACT			
i.	Traded in over-the-counter (OTC) markets.	Futures contract are traded on stock exchanges.			
ii.	Can be tailored to meet specific requirements.	Standardised - delivery date, lot size etc. is decide			
	Delivery date, lot size etc. is decided by the parties.	by the stock exchange and cannot be modified.			
iii.	These contracts are less liquid.	Futures are far more liquid.			
iv.	MTM requirement is mutually decided b/w parties.	Strict MTM requirements are decided by exchange			
۷.	Higher counter-party risk.	Lower (or negligible) counterparty risk.			
III)	BASIS	(22)			
	Basis = Spot price – Futures price				
	If Futures price > SR, i.e. basis is negative -> It is	known as contango.			
	If Futures price < SR, i.e. basis is positive -> It is	known as backwardation.			
	Towards maturity, basis = 0 (due to principle of convergence)				
IV)	CONCEPT OF OPEN INTEREST	(7, 8)			
IV)	Open interest refers to number of contracts 'Open	(7, 8)			
IV)		(7, 8)			
∣∨)	Open interest refers to number of contracts 'Open	(7, 8)

Chapter 9B **Derivatives – Options Chapter Index** PART A - Basics of Options PART B - Pricing Options (Valuation of options) PART C - Strategies and other Tiny topics ---- Student's Space for Summary chart and notes ----

PART	A: Basics of Options
------	----------------------

1.	Introduction				
	(Must refer 1 st Fun Fundas -> Diwali Lottery)				
I)	INFORMAL UNDERSTANDING: Options = Lottery				
	Option premium: You always need to pay option premium (lottery ticket) to purchase option (lottery				
	This premium (ticket price) is Non-refundable.				
	Payoff: Call option = Upside lottery. You'll gain if stock price > Strike price on expiry.				
	Put option = Download lottery. You'll gain if stock price < Strike price on expiry.				
II)	FORMAL UNDERSTANDING (Don't cram)				
	Options is a right (but not an obligation) to buy or sell a security at a specified price (known as strike				
	price) after a specified period (known as expiry).				
	At Expiry -> The contract may be settled via:				
a.	Net settlement (already discussed in Diwali lottery example)				
þ.	Physical delivery				
III)	PHYSICAL DELIVERY				
a.	CALL OPTION - Call option means a right (but not an obligation) to buy shares at Strike price.				
þ.	PUT OPTION - Put option means a right (but not an obligation) to sell shares at Strike price.				
	IN SHORT, CALL OPTION = RIGHT TO BUY				
	PUT OPTION = RIGHT TO SELL				
IV)	V. IMP - GUIDANCE NOTE FROM AUTHOR				
	For proper understanding of this chapter, think of options as 'Lottery' only.				
	Do not focus much on the 'Physical delivery' aspect.				
	This simple thing will make your chapter a whole lot easier.				

Derivatives (Options)

9B.3

V)	NOTATIONS				
	Item N	Notation	Item	Notation	
	Call buy	C+	Put buy	P+	
	Call sell	C-	Put sell	P-	
	Option premium	OP	Strike price = Exercise price	K or E	
	Current stock price	So	Stock price on expiry	ST	
	Period of expiry	T or t			
VI)	Imp! Option selling	= Writing option			
	Sometimes option se	lling is also called as 'c	pption writing.'		
	Option writer = Optic	on seller.			
VII)	NOTE – Timing of p	remium & reward			
	The price of lottery	ticket is always paid to	oday i.e. at the time of buying	of lottery.	
	Whereas reward of lo	ottery is announced at	; maturity (i.e. after some perio	od).	
	Similarly, option premium is paid today only i.e. at the time of buying options.				
	But option is exercised at maturity (if exercised).

	r tor all gue ou ant r rugpue (e: .j: :e: .,		,,,,,,,,,,,,,,,,	
2.	Understanding – Call Buyer				
•	Think — Upside lottery buyer				
•	Payoff = Max [ST - K, 0]				
•	Breakeven at K + OP.				
•	Viewpoint = Bullish				
Ex:	Nick Leeson purchased a 3-n	veeks call option on HCL T	Tech with st	rike price (K) = ₹850 at a premium of ₹28.	
i.	Interpret the position of N	ick Leeson.			
ii.	What will his payoff and pro	ofit if HCL share price on	expiry is:		
	i) ₹780	ii) ₹878		iii) ₹890	
iii.	Breakeven point				
iv.	Profit diagram of call buyer				
Ans:	i) Nick has purchased a call c	option and paid premium	of ₹28. This	premium is Non-refundable.	
	Earn if HCL price on expiry (Sī) > strike price of ₹850			
	But if S⊺ < strike price of ₹	850, then lottery fusss!			
	मिलेगा तो कुछ नहीं लेकिन	जो option premium	oay किया थ	॥ वो भी जायेगा! 😕)	
ii.	HCL Price on expiry (S⊺)	Option exercised?	Payoff	Profit/(loss)	
	780	Option lapsed	0	0 — 28 = (28)	
	878	Exercised	28	20 — 28 = 0	
	890	Exercised	40	40 — 28 = 12	
iii.	Breakeven point for call buy	yer = K + OP = 850 + 28 =	₹878		
iv.	Profit diagram of call buyer				
	±1				
	Profit	1			
		979			
	0 K = 8	878 50 Share	price (ST)		
	OP		price (31)		
	Paid = 28	Breakeven point (BEP)			
	- 20	= K + OP = 850 + 28			
		= 850 + 28 = Rs.878			

Derivatives (Options)

erivat	tives (Options)	9B.5	WWW.KRIVII.IN
3.	Understanding – C	<mark>all Seller</mark>	
•	Think — Upside lottery Seller		
•	Payoff = Opposite off call selle	er	
•	Breakeven (same as call buyer)) = K + OP	
•	Viewpoint = Bearish or not bu	llish.	
Ex:	Barings bank sold a 3-weeks ca	Ill option on HCL Tech with strike	price (K) = ₹850 at a premium of ₹28.
i.	Interpret the position of Bari	ngs bank.	
ii.	What will the payoff and prof	it if HCL share price on expiry is:	
	i) ₹780	ii) ₹878	iii) ₹890
iii.	Breakeven point		

Ans: i) Barings has sold call option and received premium of ₹28. This premium is Non-refundable.

If HCL price on expiry (Sī) crosses ₹850, then it will have to PAY the call buyer.

But if S⊺ remains below ₹850, then Baring need not to pay anything.

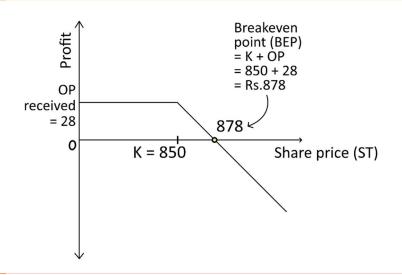

देना तो कुछ नहीं। पर option premium तो मिल गया। Full on masti! 😂

ii.	HCL Price on expiry (S⊺)	Option exercised?	Payoff	Profit/(loss)
	780	Option lapsed	0	28 — 0 = 28
	878	Exercised	-28	28 – 28 = 0
	890	Exercised	-40	28 - 40 = -12

iii. Breakeven point = Same as call buyer = K + OP = 850 + 28 = ₹878

iv. Profit diagram of call seller

iv. Profit diagram of call Seller.

inance	Acharya Jatin Nagpal (CA, FRM)	9B.6	Derivatives (Options)				
4.	<mark>Understanding – Put Buy</mark>	er					
•	Think — Downside lottery buyer						
•	Payoff = Max [K — ST, 0]						
•	Breakeven at K — OP.						
•	Viewpoint = Bearish						
Ex:	Lisa Leeson purchased a 3-weeks put opt	ion on HCL Tech with strike	price of ₹850 at a premium of ₹24.				
i.	Interpret the position of Lisa Leeson.						
ii.	What will her payoff and profit if HCL sh	are price on expiry is:					
	i) ₹780 ii) ₹890						
iii.	Breakeven point.						
iv.	Profit diagram of put buyer.						
Ans: i.	Lisa has purchased a put option (downsic	de lottery) and paid option p	remium of ₹24 (non-refundable).				
-	Lisa will be rewarded if HCL price on expi	ry (Sī) < strike price of ₹850.					
-	But if ST > strike price of ₹850, then Lisa will not be paid anything (lottery fusss !!)						
	मिलेगा तो कुछ नहीं लेकिन जो option premium pay किया था वो भी जायेगा! 😕)						
ii.	HCL Price on expiry (ST) Option ex	ercised? Payoff	Profit/(loss)				
	780 Option Exe	ercised 850 - 780 = 7	70 70 - 24 = 46				
	890 Lapsed	0	0 — 24 = (24)				
iii.	Breakeven point in case of put = K — OP	= 850 — 24 = ₹826					
iv.	Profit diagram of Put buyer						
	$\begin{array}{c} \text{Higher}\\ \text{OP}\\ \text{Paid}\\ = 24 \end{array} \qquad \begin{array}{c} 826\\ \text{Breakeven}\\ \text{point (BEP)}\\ = K - \text{OP}\\ = 850 - 24 \end{array}$	0 Share price (ST	-)				

5.	Understanding – Put Seller					
•	Think — Downside lottery Seller					
•	Payoff = Opposite of Put buyer					
•	Breakeven (same as put buyer) = K — OP.					
•	Viewpoint = Bullish or not bearish.					
Ex:	SG sold a 3-weeks put option on HCL Tech with an exercise price of ₹850 at a premium of ₹24.					
i.	Interpret the position of SG.					
ii.	What will its payoff and profit if HCL share price on expiry is:					
	i) ₹780 ii) ₹890					
iii.	Breakeven point.					
iv.	Profit diagram of put seller.					
Ans:	i) SG has sold a put option (downside lottery) and received premium = ₹24. This premium is non-refundable.					
-	If HCL price on expiry (ST) < strike price of ₹850, then SG will have to pay put buyer.					
-	But if S_T > strike price of ₹850, then SG need not to pay anything.					
	देना तो कुछ नहीं। पर option premium तो मिल गया। Full on masti! 😂					
ii.	HCL Price on expiry (S_T) Option exercised? Payoff Profit/(loss)					
	780 Option Exercised -70 24 - 70 = (46)					
	890 Lapsed 0 24-0=24					
iii.	Breakeven point in case of put (same as put buyer) = K — OP = 850 — 24 = ₹826					
iv.	Profit diagram of Put Seller					
	Breakeven f_{ij} point (BEP) g_{ij} = K - OP g_{ij} = 850 - 24					
	050 21					
	OP = Rs.826					
	received = 24 826					
	0 K = 850 Share price (ST)					
	Ψ					

inance	Acharya Jatin Nagpal (CA, FRM)	9B.8	Derivatives (Options)				
6.	Some Basic Points						
l)	OPTION PREMIUM VS FUTURES MARGIN						
1)	Do not confuse 'option premium (OP)' with margin paid on futures.						
	<u>OPTION PREMIUM</u> = You pay this amount to buy op						
	MARGIN MONEY = This is like a security deposit. It is						
	The use of	ter adjusting for from tor lossy.					
II)	MARGIN REQUIREMENT IN OPTIONS						
	OPTION BUYER -> Pays the option premium upfront	t. Need not to p	pay anything more.				
	So, no security deposit is required to be deposited	by Option buye	er. Hence, no margin requirements.				
	OPTION SELLER -> Receives option premium and rem	nains liable to pa	ay to option buyer (in case option is				
	exercised). Hence, we require security deposit from	option seller. S	o, the option seller must deposit margin.				
III)	PAYOFF FORMULAS						
	For call buyer = Max [ST — K, 0]						
	For call seller = opposite of call buyer.						
	For put buyer = Max [K — ST, 0]						
	For put seller = opposite of put buyer.						
IV)	PAYOFF VS PROFIT						
	PAYOFF = Cash flow on the expiry.						
	PROFIT = You net profit/loss after adjusting for option premium.						
	Net Profit for option buyer = Payoff — Premium paid						
	Net Profit for option seller = Premium received —	Payoff					
V)	BREAKEVEN POINT OF OPTIONS						
	For call options = OP + Premium paid						
	For Put options = OP - Premium paid						
VI)	ROLE OF VOLATILITY IN OPTIONS						
	Option buyer = Loves volatility. He loves wide swin	gs in price. Becc	use he has no liability whatsoever.				
	But a big opportunity to earn if price moves by b	ig amounts.					

	Option seller = Hates volatility. He hates wide swings in price. He prefers low volatility scenarios (as high
	volatility poses a big risk for them).
VII)	RISK NATURE
	Option buyer -> Risk averse. Want to take limited risk.
	Option seller -> Risk taker or less risk averse.
VIII)	EUROPEAN OPTIONS VS AMERICAN OPTIONS
	European option -> Can be exercised only on maturity.
	American options -> Can be exercised even before maturity.
	(For basic understanding treat them as same. Later we will explore more on this topic.)

II)	CALCULATING PROBABILITIES (concept & understanding)						
	In the above example the probabilities were directly given in ques. Now we'll learn how to calculate thes						
	probabilities.						
Ex:	Calculate the probabilities in the previous example (assuming it was not given in ques).						
Ans:	Pictorial representation of previous ques.						
	500 Probability = P 580 Su Stock price if price moved upward = Su After 3 months						
	$\frac{SUO}{Probability = 7.0} = \frac{1440}{440} \text{ Sd}$ $K = 505$ $Rf = 6\% \text{ p.a.}$ $\frac{SUO}{Probability = 7.0} = \frac{440}{440} \text{ Sd}$ $Stock \text{ price if price}$ $moved \text{ downwards} = \text{Sd}$						
i)	Let probability of stock price going up (to ₹580) be 'p'.						
	Probability that stock price will fall down (to ₹440) = '1-p'						
	Therefore, Expected value of stock after 1-year (S_T) = 580p + 440(1-p) (1)						
ii)	Since we are pricing in risk-neutral world, So expected return of each asset = Rf.						
ii) P							
	Value of stock after 1-year (ST) = 500(1+rf) = 500 × 1.06 = ₹530 (2)						
	Value of stock after 1-year (ST) = 500(1+rf) = 500 × 1.06 = ₹530 (2) <u>From (1) and (2), we can say</u>						
	Value of stock after 1-year (ST) = 500(1+rf) = 500 × 1.06 = ₹530 (2) <u>From (1) and (2), we can say</u> 580p + 440(1-p) = 530						
	Value of stock after 1-year (ST) = $500(1+rf)$ = $500 \times 1.06 = ₹530$ (2) From (1) and (2), we can say (2) 580p + 440(1-p) = 530 (2)						
	Value of stock after 1-year (ST) = $500(1+rf) = 500 \times 1.06 = ₹530$ (2) From (1) and (2), we can say (2) 580p + 440(1-p) = 530 (2) $580p + 440 - 440p = 530$ (2) $p(580 - 440) = 530 - 440$ (2) $p = 530 - 440$ (2)						
	Value of stock after 1-year (S _T) = 500(1+rf) = 500 × 1.06 = ₹530(2) From (1) and (2), we can say 580p + 440(1-p) = 530 580p + 440 - 440p = 530 p(580 - 440) = 530 - 440 p = 530 - 440 => $p = 64.29%$ and $1-p = 35.71%$						

Finance Acharya Jatin Nagpal (CA, FRM)

	Acharya Jatin Nagpai (CA, FRM) 98.14 Derivatives (Options						
III)	CRUX – 2 STEPS FOR EXAM						
Step 1:	Calculate Risk-Neutral probabilities (directly using formula)						
	$p = S_0 (1+Rf)^n - S_D$ Where: $S_D = Downside stock price$						
	$\frac{1}{S_{U} - S_{D}} = \frac{1}{S_{U} - S_{D}}$ $S_{U} = Upside stock price$						
Step 2:	Calculate value of option (= PVCI)						
	Value of Option = PVCI = Upside payoff x p + Downside Payoff (1-p)						
	$(1 + Rf)^n$						
	Where: Upside payoff = Payoff from option if stock price moves upward.						
	Downside payoff = Payoff from option if stock price moves downward.						
IV)	If Rf is given as continuously compounded rate						
	In case of continuous compounding, use e ^{rt} in place of (1+r). Rest everything remains same.						
	<u>So, formulas become:</u>						
	$p = S_0 e^{rt} - S_D$						
	$\frac{1}{S_{\rm U}-S_{\rm D}}$						
	<u></u>						
	Value of Option = PVCI = Upside payoff x p + Downside Payoff (1-p)						
	Value of Option = PVCI = <u>Upside payoff x p + Downside Payoff (1-p)</u> e ^{rt}						
	e ·						
V)	MAHA IMPORTANT 🔔						
	The above formula is for Risk-Neutral probabilities.						
	This is what we require to calculating values in risk-neutral world.						
	SLIP POINT - Sometimes examiner intentionally gives real world probabilities to confuse students.						
	DO NOT USE those Real world probabilities.						
	Calculate your own risk-neutral probabilities (using above formula) and use it to find option value.						
Ex:	An investor is interested in purchasing AB ltd.'s shares. The investor expects that there is a 70% chance						
27.	that the price will go up to ₹650 or a 30% chance that it will go down to ₹450, 3-months from now.						
->	These are Investor's expectations based on 'Real-world probability.'						

9B.14

////////	35.13 WWWWWWW
VI)	ALTERNATE FORMULA OF PROBABILITY CALCULATION
	We just learned that:
	$p = \frac{S_0 (1+rf)^n - S_D}{2}$
	Su - SD
	Dividing both numerator and denominator by S_0 , we get
	$p = (1 + rf)^n - d$ Where: $d = downmove factor = S_D \div S_0$
	$u = d$ $u = upmove factor = S_U \div S_0$
Ex:	Stock price today (So) = ₹500. It can move up to ₹580 in a year or fall down to ₹440. Calculate risk-neutro
	probabilities. Risk-free rate = 6% p.a.
Ans:	d = downmove factor = 440 / 500 = 0.88
	u = upmove factor = 580/500 = 1.16
	$p = (1 + rf)^n - d = 1.06 - 0.88 = 0.6429 \text{ or } 64.29\%$
	u – d 1.16 – 0.88
	1 – p = 35.71%
Note:	Which formula to use in exam?
Ans:	You can use any formula. We believe the first one (mentioned earlier) is bit faster though.

6.	Two-Stage Binomial model	
	This is exactly like 1-stage binomial model (which we just discussed	l).
	But it is more like solving three ques in one single ques. 😅	/
Ex:	: Consider a 2-year call option on a stock with strike price of ₹65.	The stock is currently trading at ₹6
	Consider two periods of 1-year each. The stock can move either 1	0% up or 5% down in the first peri
	The stock is expected to move 20% up or 10% down in the seco	nd period.
	Calculate the value of call option each node. Risk-free rate = 6% p	.a.c.c. Given e ^{0.06} = 1.0618.
Ans:	: First — make diagram of the entire	scenario.
		Call
		payoff

		e ^{0.06}				

7.	Delta-hedge approach (11, 12)
1)	UNDERSTANDING DELTA
	Delta = Change in option value due to ₹1 change in stock price.
	Delta of option = <u>Change in option price</u>
	Change in stock price
Ex:	Stock price Call price Put price
	200 15 20
	220 27 12
	Calculate delta of call and delta of put.
Ans:	Delta of Call = <u>Change in call price</u> = <u>27 - 15</u> = +0.6
	Change in stock price 220 — 200
	Delta of Put = <u>Change in put price</u> = <u>12 - 20</u> = -0.4
	Change in stock price 220 — 200
	NOTES:
1.	Delta of call is always POSITIVE (call option value increases if price of stock increases).
2.	Delta of Put is always NEGATIVE (Put value falls due to increase in stock price).
3.	Delta of share = +1 (always, obviously).
4.	(Extra coverage — Not for exam) Delta of futures is also +1.
	DELTA OF OPTIONS SELLER:
	Option seller is in opposite position of option buyer. So for option seller, delta effect is opposite.
	i.e. call seller -> Negative Delta
	Put seller -> Positive delta
II)	DELTA OF PORTFOLIO
	Delta of portfolio = Sum total of delta of individual positions
Ex:	You bought 100 shares and also bought 200 call options on that share. Find delta of portfolio if delta o
	call option is 0.6.

	DELTA-HEDGE PORTFOLIO					
	If delta of a portfolio = 0, then it means:					
	'If stock price changes by ₹1 then total po	ortfolio value will cha	ange by 0.'			
	In other words, our portfolio will not be a	affected by any chan	ge in value of stock.			
	Such a portfolio will provide us a RISK-LESS	guaranteed Return.				
Ex:	Sold 100 Call options on XYZ ltd with delta =	0.4. How many share	s should I buy to con	struct a delta-hed		
	portfolio.		5			
Ans:	Position	Delta				
	Sell 100 call options	(100) × 0.4 = -	-40			
	Buy 100 × Delta shares = 100 × 0.4 = 40 shar	es 40 × 1 = +40				
		<u> Total Delta =</u>	0 → Delta	n hedged.		
	In other words, our portfolio will not be a	affected by change in	i share price.			
Ex:	A stock is currently trading at ₹200. It ca	n move up to ₹230 c	or fall down to ₹180 i	n 1-year time fran		
	A 1-year call option with strike price of $\gtrless 2$	10 is available on this	stock. Find the value	of call if rf = 5%		
	Use Delta-neutral approach.	Use Delta-neutral approach.				
Ans:	<u>Step 1 — Calculate delta of option</u>					
	Delta of call = <u>Change in call payoff</u> =	<u> 20 0</u> = 0.4				
	Change in stock price 230 — 180					
	<u>Step 2 — Construct a delta hedged portfolio</u>					
	Sell 100 call options and Buy 100 \times Delta shares i.e. 100 \times 0.4 = 40 shares.					
	Since our portfolio is delta-hedged, so it m	eans it will not get a	affected by any chang	ge in share price.		
	AUTHOR NOTE - PROOF (NOT REQUIRED IN EX	AM):				
		AM): es = 40 × 230 =	₹9,200			
	i) Portfolio Value if S⊺ = 230: 40 shar		₹9,200 (<u>₹2000)</u>	₹7200		
	i) Portfolio Value if S⊺ = 230: 40 shar 100 call	es = 40 × 230 =		₹7200		

Finance Acharya Jatin Nagpal (CA, FRM)

	5 51 .	•		1	
	<u>Step 3 — Calculate value of opt</u>	<u>.ion</u>			
	AUTHOR NOTE: This portfolio wi	ll offer us a GUARANTEED cash	flow of ₹7200 after 1-ye	ar.	
	So, cost of por	tfolio today = PV of cash flows	DISCOUNTED AT RISK-FRE	e rate.	
	40×200 — 100×C ₀ = 7200 / 1.05				
	8,000 — 100C0 = 6857.14				
	C ₀ = ₹11.43				
IV)	Delta-Hedge Portfolio in (CASE OF PUT OPTIONS			
	Since put options have negative	e delta, so in order to construc	t a delta hedged portfol	io -	
	BUY 100 put options and Buy 10	00 x Delta shares. (Rest everythi	ng is same as call).		
Ex:	A stock is currently trading at	₹300 It can mave up to ₹330	or fall down to ₹290 in	1-upar	
٢٨.	A 1-year put option with strike			-	
Ans:	Step 1 - Calculate delta of opt		ing succes, this value of pu	•• •• •• • • • • • • • • • • • • • • •	
<u>л</u> нъ.					
	Delta of Put = Change in Put payoff = 0 20 = -0.5 Change in stock price 330 290				
	<u>Step 2 — Construct a delta hedged portfolio</u>				
	BUY 100 put options and Buy 10	00 x Delta shares i.e. 100 x 0.5 =	50 shares.		
	Step 3 — Portfolio cash flow at	t expiry			
	Portfolio Value if S⊺ = 330:	50 shares = 50 x 330 =	₹16,500		
		100 Put buy = 100 x 0 =	<u>Nil</u>	₹16,500	
	Author Note: Portfolio value n	vill remain same irrespective of	S _T . So, no need to show	value at ST = 290.	
	<u>Step 4 - Calculation of option value</u>				
	Cost of constructing this portfolio today = PV of ₹16,500 discounted at Rf.				
	$50.S_0 + 100.P_0 = 16,500 / 1.06$				
	50×300 + 100P ₀ = 15,566				
	P₀ = ₹5.66				

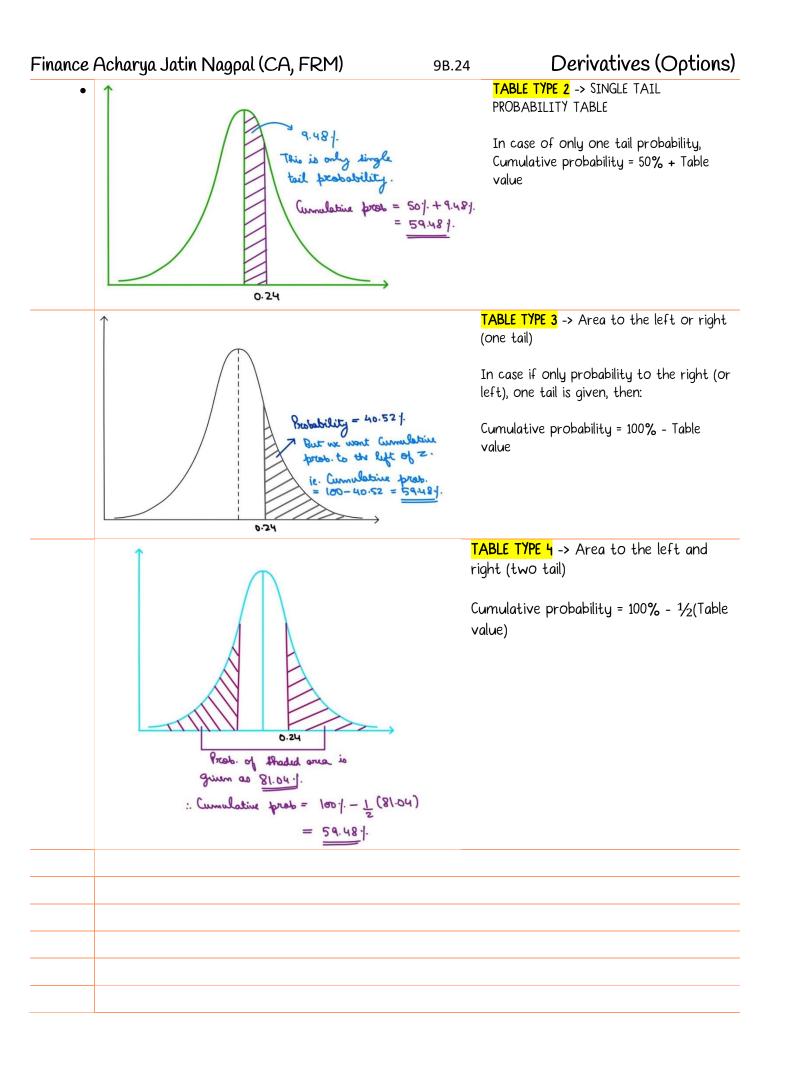

8.	ives (O Minim	um Value of o	ntion	(1, 2)
0.			s specifically ask to calculate MINIM	
I)	EUROPEA	AN OPTIONS		
	Min. value	of call option = $S_0 - K$	(e ^{-rt}	
	Min. value	e of put option = Ke ^{-rt} -	- S ₀	
II)	AMERICA	IN OPTIONS		
	Min. value	of call option = $S_0 - K$	<u> </u>	
	Min. value	e of put option = $K - S_0$	0	
	If value c	of option is less than m	ninimum value, then arbitrage will b	e possible.
Ex:	Current s	tock price (S0) = ₹500. /	An American call option with exerc	ise price (K) of ₹450 is currently
	trading at	t ₹20. Show how arbitr	age is possible.	
Ans:	Buy call option (for ₹20) and immediately ask option seller to pay ₹50 (500 $-$ 450).			
	Hence, ear	rning an arbitrage profi	it of ₹30 (i.e. 50 — 20).	
	So, as per	Principle of No Arbitro	age -> The min. price of American c	call should be ₹50 (i.e. So — K)
III)	IMPLICAT	TION OF AMERICAN OP	PTION	
	If ques m	nentions nothing -> Ass	sume European option (Nothing spec	cial to be done).
	If ques sp	pecifically mentions 'Ar	merican' option, then:	
	Step 1)	Calculate value exactlų	y like European option (no differenc	e here).
	Step 2)	Check that Option valu	ue is not less than the Minimum val	lue (as discussed above).
	Step 3)	If option Value < Minin	num value, then give note that val	ue cannot be less than minimum value
		Hence, take value = Mir	nimum value.

WWW.KRIVII.IN

i i v u c	36.23 WWW.RRIVII.II
10.	How to find d1 and d2? (14, 15, 16, 17
1.	We can get the values of d1 and d2 from the Normal distribution table.
	Let's say, I get d1 = 0.24, then value of N(d1) can be taken from Normal distribution table (as shown below
	Cumulative Area from normal distribution table.
	z 0.00 0.01 0.02 0.03 0.04 0.05 0.06 0.07 0.08 0.09
	0.0
	0.1
	0.2 0.5948 0.5987
	So, if d1 = 0.24, then cumulative probability of to the left of 0.24 i.e. N(d1) = 0.5948 or 59.48%
	59.48.
	This is Curroulative
	probability. This
	is what use worst.
	0.24
2.	HOW TO CALCULATE 0.246 FROM ABOVE TABLE?
	Value at 0.24 = 59.48%
	Value at 0.25 = 59.87%
	\therefore Value at 0.246 = 59.48% + (59.87 - 59.48) × 0.006 = 59.714
II)	0.01 DIFFERENT TYPES OF ND TABLE
117

11.	BSM in case of Dividend	paying stocks	
	If dividend is given in ques -> Find ex-	dividend stock price before calcu	lating option price using BSM.
Step 1:	Find S*		
	where S* = $S_0 = PV$ of dividends	Where dividend is giv	ven in amount
	or $S^* = S_0 e^{-yt}$	Where dividend is given the two terms of the terms of t	ven in % i.e. dividend yield is given
Step 2:	Use S* in place of S ₀ in the entire BSM	formula. (Including in the form	ula for d1 and d2).
	Value of Call option = S*N(d ₁) –	Ke ^{-rt} N(d ₂)	
	Value of Put option = Ke ^{-rt} [1 - N	I(d₂)] - S*[1 - N(d₁)]	
	Where: d1 = Ln (S* / K) + (rf +	$\sigma^2/2$).t	
	σ√ŧ		

	Acharya Jatin Na	gpal (CA, FRM)	98.26	Derivatives (Option Strategies and Other Tiny topics
1.	Option Strate	gies		(18, 19, 20)
	Here we will buy or s	sell more than 1 option.		
	Two basic steps			
Step 1:	Calculate Net premiu	m paid or received from	all the options.	
Step 2:	Calculate payoff fro	n each option (separate	ly).	
	Total payoff = Sum (of individual payoff.		
	Net profit = Total po	ayoff — Premium paid.		
Ex:	A trader bought 2 lo trading at ₹1600. Def		ot of put option on f	the stock of Tech Filtd. Stock is curren
		Strike price	Premium paid	Lot size
	Call option	1700	160	500
	Put option	1400	90	500
i)	Find the profit or lo	ss from this strategy if	price on maturity (S	ī) turns out to be:
	Case a — ₹1550	Case b _ ₹1950		c _ ₹1100
	Find the breakeyon p	oints of the above strat	.eqy.	
ii)	Find the preakeven p			
ii) Ans:	i) Calculation of prer			
		nium paid		
	i) <u>Calculation</u> of prer	nium paid 00 x 2 = 1.6L		
	i) Calculation of pren Call premium: 160 x 5	nium paid 00 x 2 = 1.6L		
	i) Calculation of pren Call premium: 160 x 5	nium paid 00 x 2 = 1.6L 00 = <u>0.45L</u> Total = <u>2.05L</u>		
	i) Calculation of pren Call premium: 160 x 5 Put premium: 90 x 50	nium paid 00 x 2 = 1.6L 00 = <u>0.45L</u> Total = <u>2.05L</u>	Total	Net Profit / (loss)
	i) Calculation of pren Call premium: 160 x 5 Put premium: 90 x 50 <u>Calculation of payof</u>	nium paid 00 x 2 = 1.6L 00 = <u>0.45L</u> Total = <u>2.05L</u> f and profit		Net Profit / (loss) = Payoff _ prem.
Ans:	i) Calculation of pren Call premium: 160 x 5 Put premium: 90 x 50 <u>Calculation of payof</u> Call	nium paid 00 x 2 = 1.6L 00 = <u>0.45L</u> Total = <u>2.05L</u> f and profit Put	Total	
Ans: - <u><u>S</u>T</u>	i) Calculation of pren Call premium: 160 x 5 Put premium: 90 x 50 <u>Calculation of payof</u> Call Payoff	nium paid 00 x 2 = 1.6L 00 = <u>0.45L</u> Total = <u>2.05L</u> f and profit Put Payoff	Total Payoff	= Payoff _ prem.

ii)	Breakeven points
	In such cases, 2 breakeven points exists
	$1^{st} - 1700 + (160 \times 2 + 90)/2 = 1905$
	2 nd - 1400 - (160×2 + 90) = 990
2.	Intrinsic & Extrinsic Value (IV, EV)
	We can bifurcate option value into $-$ Intrinsic value (IV) and extrinsic value (EV).
	Total Value of option = IV + EV
Ex:	A Call option with strike price = ₹500 is trading at ₹70 (It means option premium = ₹70).
	Bifurcate the value of option into IV and EV if current stock price = ₹550.
Ans:	Intrinsic value (IV) = How much you are already winning today or your current payoff = 550 — 500 = ₹50
	Extrinsic value (EV) = Option premium - IV = 70 _ 50 = ₹20
II)	CAN IV BE NEGATIVE?
	No. Since Payoff under option can never be negative. So, IV can never be negative.
	It can be zero (if you are not winning anything today) but can never be negative.
III)	CRUX
III) 1.	CRUX IV of call option = Max [S ₀ - K, 0]
1.	IV of call option = Max [S0 — K, 0]
<u> </u>	IV of call option = Max [S ₀ - K, 0] IV of put option = Max [K - S ₀ , 0]
1. 2. 3.	IV of call option = Max [S ₀ - K, 0] IV of put option = Max [K - S ₀ , 0] EV of any option = Option price - IV
1. 2. 3. 4. 5.	IV of call option = Max [S ₀ - K, 0] IV of put option = Max [K - S ₀ , 0] EV of any option = Option price - IV IV of any OTM option = 0. Hence, in such case, EV = Option value. EV IS ALSO KNOWN AS TIME VALUE OR VOLATILITY PREMIUM
1. 2. 3. 4.	IV of call option = Max [S ₀ - K, 0] IV of put option = Max [K - S ₀ , 0] EV of any option = Option price - IV IV of any OTM option = 0. Hence, in such case, EV = Option value.
1. 2. 3. 4. 5.	IV of call option = Max [S ₀ - K, 0] IV of put option = Max [K - S ₀ , 0] EV of any option = Option price - IV IV of any OTM option = 0. Hence, in such case, EV = Option value. EV IS ALSO KNOWN AS TIME VALUE OR VOLATILITY PREMIUM
1. 2. 3. 4. 5. 3.	IV of call option = Max [S ₀ - K, 0] IV of put option = Max [K - S ₀ , 0] EV of any option = Option price - IV IV of any OTM option = 0. Hence, in such case, EV = Option value. EV IS ALSO KNOWN AS TIME VALUE OR VOLATILITY PREMIUM In the Money (ITM), Out of the Money (OTM) & At the Money (ATM)
1. 2. 3. 4. 5. 3. ()	IV of call option = Max [S ₀ - K, 0] IV of put option = Max [K - S ₀ , 0] EV of any option = Option price - IV IV of any OTM option = 0. Hence, in such case, EV = Option value. EV IS ALSO KNOWN AS TIME VALUE OR VOLATILITY PREMIUM In the Money (ITM), Out of the Money (OTM) & At the Money (ATM) INFORMAL UNDERSTANDING
1. 2. 3. 4. 5. 3. 1) Illus:	IV of call option = Max [S ₀ – K, 0] IV of put option = Max [K – S ₀ , 0] EV of any option = Option price – IV IV of any OTM option = 0. Hence, in such case, EV = Option value. EV IS ALSO KNOWN AS TIME VALUE OR VOLATILITY PREMIUM In the Money (ITM), Out of the Money (OTM) & At the Money (ATM) INFORMAL UNDERSTANDING Consider a call option with K = ₹500
1. 2. 3. 4. 5. 3. 1) Illus: i)	IV of call option = Max $[S_0 - K, 0]$ IV of put option = Max $[K - S_0, 0]$ EV of any option = Option price - IV IV of any OTM option = 0. Hence, in such case, EV = Option value. EV IS ALSO KNOWN AS TIME VALUE OR VOLATILITY PREMIUM In the Money (ITM), Out of the Money (OTM) & At the Money (ATM) INFORMAL UNDERSTANDING Consider a call option with K = ₹500 If $S_0 = ₹560$ - Then call buyer is winning the game (as on today). This is known as 'In the money'. (ITM)
1. 2. 3. 4. 5. 3. 1) Illus: i) ii)	IV of call option = Max $[S_0 - K, 0]$ IV of put option = Max $[K - S_0, 0]$ EV of any option = Option price - IV IV of any OTM option = 0. Hence, in such case, EV = Option value. EV IS ALSO KNOWN AS TIME VALUE OR VOLATILITY PREMIUM In the Money (ITM), Out of the Money (OTM) & At the Money (ATM) INFORMAL UNDERSTANDING Consider a call option with K = ₹500 If $S_0 = ₹560$ - Then call buyer is winning the game (as on today). This is known as 'In the money'. (ITM) If $S_0 < ₹500$, say ₹470 - Then call buyer is losing as of now. This is known as 'out of money'. (OTM)

- II)	FORMAL UNDERSTANDING				
	For call option	For put option			
	When So > K = ITM	When $S_0 < K = ITM$			
	When S₀ = K = ATM	When So = K = ATM			
	When So < K = OTM	When So > K = OTM			
4.	Put call parity Theory	(PCP)			
	Value of call + PV of Strike	price = S ₀ + Value of Put)		
Ex:	A stock is currently trading at ₹850		with strike price of ₹860 is trading o		
	₹40. Find the value of put if risk-fro				
Ans:		strike price = S ₀ + Value of put			
	40 + 860	= 850 + Value of put			
	1 + 0.07×6/1	2			
	Value of put = ₹20.92				
II)	V. IMP NOTE				
	PCP relation only holds true if Both	call and put options are:			
	- On the same stock				
	- Have same strike price				
	- Have same maturity				
III)	SIGNIFICANCE OF PCP				
III)	SIGNIFICANCE OF PCP				
)		d to calculate both value of call	and put, then you can use PCP.		
)	For exam — i) If you are require	d to calculate both value of call ally designed on PCP, then of cour			
)	For exam — i) If you are require	ally designed on PCP, then of cour	se it is to be used.		
5.	For exam — i) If you are require ii) If ques is specific	ally designed on PCP, then of cour	se it is to be used.		
	For exam — i) If you are require ii) If ques is specific In practical world — If PCP does no	ally designed on PCP, then of cour ot hold, then arbitrage is possible.	se it is to be used. So, PCP must hold true as per PONA

PART F - Other Topics - Nostro-Vostro, Forex Exposure ---- Student's Space for Summary chart and notes ----

1.	Introduc [®]	tion			
I)	HOME CURRENCY (HC) VS FOREIGN CURRENCY (FC)				
	Currency of ų	jour country = Home currency (HC)			
	All other curr	encies = Foreign currency (FC)			
	For India ->	HC = ₹ Other currencies (sucl	n as \$, €, £ etc) = FC		
	For US ->	HC = \$ Other currencies (such	n as ₹, €, £ etc) = FC		
II)	SPECIAL TIP	- FC IS NOT MONEY			
	Always see FC	C as a financial asset and not as 'mone	y'.		
Ex:	You want to	buy a car of ₹10 Lacs.			
	CASE 1 — YOU HAVE TCS SHARES WORTH ₹10L		CASE 2 — YOU HAVE \$ WORTH ₹10L		
-	Car dealer wo	n't accept TCS shares. He wants ₹.	Car dealer will not accept \$. He wants ₹.		
-	So, 1 st Sell you	ur TCS shares and get ₹.	So, 1 st Sell your \$ and get ₹.		
-	Use this ₹ to	pay car dealer.	Use this ₹ to pay car dealer.		
	Conclusion —	Only HC is Money & all the FC are merel	y Financial Assets (just like share etc.)		
2.	Basics o	<mark>f Exchange rates</mark>			
I)	WHAT IS EXC	HANGE RATE			
	Interpret ->	1 Share of Ashok Leyland (AKL) = ₹160)		
	This is the Price Tag of AKL share. i.e. you can buy or sell AKL shares at ₹160.				
		We need price tag of share (i.e. AKL on left hand side) whenever buying/selling AKL share			
		We need price tag of share (i.e. AKL o	on left hand side) whenever buying/selling AKL sha		
	Similarly ->	We need price tag of share (i.e. AKL o 1 \$ = ₹80	on left hand side) whenever buying/selling AKL sha		
	Similarly ->	· · · · · · · · · · · · · · · · · · ·			

Forex		10A.3	WWW.KRIVII.IN			
II)	ONE-WAY QUOTE & TWO-WAY QUOTE					
	One-way Quote - 1 \$ = ₹70		(Bid rate and ask rate are same)			
	Two-way Quote – 1 \$ = ₹70	- 70.5	(Bid rate & Ask rate is different)			
			、			
	Bid rate of BANK	Ask rate or offer rate				
	or Buying rate	or Selling rate of BANK				
-	Bid rate is always < Ask rate (as ban	k will obviously buy at lower 1	rate and sell at higher rate.)			
III)	BID-ASK SPREAD					
	The difference between bid rate and	l ask rate is known as Bid-Ask	spread.			
	Bid-ask spread = Ask rate (-) Bid rat	е				
	in % = <u>Ask rate (-) Bid rat</u>	<u>e</u> × 100				
	Bid rate					
Ex:	1 \$ = ₹ 70 — 70.5	_				
Ans:	Then bid-ask spread = 70.5 — 70 = ₹0.	5				
IV)	QUOTE CONVERSION					
Ex:	1 \$ = ₹80					
574	Then 1 ₹ = 1/80 \$					
Crux:	Take reciprocal in case of 1-way quo	te.				
	TURE TECHTECUL III OUGE OF I-WUY QUOLE.					
Ex:	1 \$ = 80 — 80.5					
	$1\overline{z} \neq \underline{1} - \underline{1} \mathbf{X} \mathbf{X}$					
	80 80.5					
	Because, this means -> 1₹ = 0.0125 — 0.0124					
	But Bid rate can never be less than ask rate !! So, this is wrong.					
	Correct quote -> 1₹ = 1 _	1				
	80.5	80				
Crux:	In case of 2-way quote -> Take reci	procal and switch places.				

3.	Currency Conversion			
I)	Rule of CURRENCY CONVERSION in case of 1-Way Quote			
.,	Imp! Before proceeding with currency conversion -> always write the quote in both the forms			
Ex:	If 1 \$ = ₹70 -> This is price tag of \$ (given in question)			
	Also write price tag of ₹ -> ₹1 = 1/70\$ (you can either write it in rough or as part of ans)			
Ex:	1 \$ = ₹70. Calculate amount to be received or paid when			
	i) Selling 100 \$ ii) Selling ₹14000			
Ans:	RULE: When buying or selling \$> MULTIPLY with price tag of \$ (i.e. \$ on LHS)			
	Similarly, when buying or selling $ earrow> MULTIPLY$ with price tag of $ earrow ($ i.e. $ earrow on LHS)$			
i)	Selling \$ -> Multiply with price tag of \$ (1\$ = ₹70)			
	100 \$ = 100 × 70 = ₹7000			
ii)	Selling ₹ -> Multiply price tag of ₹ (1₹ = 1/70 \$)			
	₹ 1,40,000 = 1,40,000 × 1/70 = \$2000			
II)	2 Step Rule of CURRENCY CONVERSION in case of 2-Way Quote			
	Caution - This is an easy but still a slippery area. Always always follow this 2 steps rule in exan	im.		
	Students often get overconfident and make mistake in this area (8 marks gone to gutter $old B$)			
Step 1:	(Same as above) 'Multiply' with the price tag of the currency which is bought or sold.			
Step 2:	Since bid rate and ask rates are separately given. So, you must identify the correct rate.			
	• If customer is buying $ ightarrow$ Bank is selling $ ightarrow$ Ask-rate of bank.			
	• If customer is selling \rightarrow Bank is buying \rightarrow Bid-rate of bank.			
Ex:	1 $\$$ = 70 — 71. Calculate amount to be received or paid when			
i)	Buying \$2,000 (iii) Selling ₹50,000			
ii)	Selling \$2,000 (iv) Buying ₹50,000			
Ans:	1 st write the quote in both the forms.			
	1\$ = ₹70 - 71			
	1 ₹ = 1/71 - 1/70 \$			

Forex

i)	Buying \$ 2,000.		
	tep 1 — Buying \$. So, pick price tag of \$> 1 \$ = ₹70 — 71		
	Step 2 — We are buying \$. So, bank is selling it. Rate applicable = Ask rate = 71.		
=>	2000 × 71 = ₹1,42,000.		
ii)	Selling \$2000> 2000 × 70 = ₹1,40,000.		
iii)	Selling ₹50,000.		
	Step 1 — Pick price tag of ₹		
	Step 2 — We are selling ₹. So, bank is buying it. Rate applicable = Bid rate = 1/71.		
=>	50,000 × 1/71 = \$ 704.23		
iv)	Buying ₹50,000> 50,000 × 1/70 = \$714.26		
4.	Cross Rates		
l)	CROSS RATES - IN CASE OF 1 WAY QUOTE		
	Simply multiply rates to get the desired quote.		
Ex:	1\$ = ₹50 (₹/\$)		
	1f = 1.4 (\$/f)		
	Find 1£ = ₹?		
Ans:	<u>₹</u> = <u>₹</u> × <u></u> \$ = 50 × 1.4 = ₹70.		
	£ \$ £		
II)	CROSS RATES – IN CASE OF 2 WAY QUOTE		
	Same as above. Multiply all the bid rates with other bid rates & all the ask rates with other ask rates.		
Ex:	$1\$ = \pounds 0.762 - 0.770$ (£/\$)		
	1£ = ₹82.3 - 82.9 (₹/£)		
	1¥ = ₹0.461 - 0.468 (₹/¥)		
	Find ¥/\$.		
Ans:	$\underline{\mathbf{Y}} = \underline{\mathbf{f}} \times \underline{\mathbf{x}} \times \underline{\mathbf{x}}$		
	\$ \$ £ ₹		
	¥/\$ = 0.762 × 82.3 × 1/0.468 — 0.77 × 82.9 × 1/0.461 = 134 — 138.47		

ance	Acharya Jatin Nagpal (CA, FRM)	10A.6	Fore
5.	Other points related to exc	hange rate	
I)	EXCHANGE MARGIN OR COMMISION		
	This is a margin that is charged from cust		
	Buying commission = rate (-) % of commis		
	Selling commission = rate (+) % of commis		
	If given in amount, then directly add or su	ıbtract such commission.	
\bigwedge	Exchange margin is not applicable in a	case of inter-bank dealings.	
	In case of cross rates - Exchange ma	argin is added / deducted in final cross rate.	
II)	EXPECTED RATE		
	Expected rate = Rate x probability	(Just like you cal. any other expected value)	
III)	CURRENCY PAIRS		
	Sometimes quotes may be given as 'Curre	ncy pairs' i.e. as per ISO standard.	
Ex:	USD/INR → It means ₹/\$ (& not \$/₹)		
#	How to identify currency pairs?		
•	All Capitals •	3 alphabets	
•	No Symbols (₹, \pm) X •	Currencies are separated by '/' (i.e. slash)	
•	Stronger / Weaker currency (Stronger curr	ency is denoted first, followed by weaker currency)	
#	Most popular currencies pairs:		
	USD/INR EUR/USI	D EUR/CAD	
	USD/CHF EUR/INF	EUR/JPY	
	USD/CAD EUR/GB	P EUR/AUD	
	GBP/INR GBP/US	D	
IV)	BASE CURRENCY AND PRICE CURRENCY		
	The currency on LHS is known as 'Base cur	rency' and the currency on RHS is known as 'Price cu	rrency'.
	For practical purpose -> Use the 2-step rul	e which is discussed earlier. Don't get confused with	this.
Ex:	1\$ = ₹80 → Base currency = \$, Price cu	irrencu = ₹	
۲٨.			

Forex	10A.7 WWW.KRIVII.				
V)	DIRECT AND INDIRECT QUOTE				
	Direct quote = When FC is on LHS.				
	Indirect quote = When HC is on LHS.				
Ex:	1 share of Ashok Leyland = ₹160 -> This is direct quote.				
	But 1 ₹ = 1/160 or 0.00625 shares of Ashok Leyland -> This is Indirect quote.				
Ex:	Similarly, 1\$ = ₹80 -> This is direct quote for INDIANS and Indirect Quote for Americans.				
	1₹ = 1/80 or 0.0125\$ -> This is direct quote for Americans and Indirect Quote for Indians.				
VI)	INCORRECT CURRENCY PAIRS QUOTE				
•	USD / INR = 80 -> This is a currency pair. This means 1 \$ = ₹80.				
•	USD / ₹ = 80 -> Technically this is not a currency pair (as both the currencies in a currency pair				
	should be represented by 3 Capital letters as per ISO standard). But as per our				
	common-sense, we know that it means 1 $\$ = 30$ (& not other way around).				
VII)	INTER-BANK MARKET AND RETAIL MARKET				
•	Inter-bank market = When 1 bank buys or sell FC to another bank.				
•	Retail market = When a customer buys or sell FC to a bank. Exchange margin is applicable in such cases.				
	The final rate is known as 'MERCHANT RATE.'				
	Merchant rate = Inter-bank rate ± Exchange margin				
Ex:	1 \$ = ₹80 — 80.5. Exchange margin = 0.5%.				
i)	A customer wants to buy \$1000 from Bank A. Find ₹ payable.				
ii)	Let us say that Bank A currently does not have \$1000. So, Bank A buys \$1000 from Bank B. Find ₹ paya				
Ans:	i) Customer wants to buy \$1000. So, Bank's selling rate (Ask rate) will be applicable.				
	1\$ = 80.5 + 0.5% = ₹80.9025				
	Total ₹ payable = 80.9025 × 1000 = ₹80,902.5				
ii)	Bank A wants to buy \$ from another Bank B — Since Bank B is selling \$. So selling rate will be applicable.				
	1\$ = 80.5. Total ₹ Payable by bank A = 80.5 × 1000 = ₹80,500.				
	1				

6.	Currency Forwards			
I)	INTRODUCTION			
	Just like we can buy or sell stock Forwards. Similarly, we can buy/sell forward on any currency.			
Ex:	You bought 3-months \$ forward at ₹82.			
	Interpretation — You'll come after 3 months and buy \$ at ₹82 per \$.			
	Contract = entered today. Rate = fixed today.			
	But \$ will NOT be purchased today. It will be purchased after 3m.			
II)	FORWARD PREMIUM & DISCOUNT			
	If forward rate (FR) > Spot rate (SR)> Premium			
	FR < SR> Discount.			
•	Premium or Discount = Forward rate — Spot rate -> If this is positive = Premium			
	-> If FR — SR is negative = Discoun			
•	Premium or discount % = Forward rate — Spot rate x 12			
	Spot rate Months			
Ex:	$1 \leq = 770$ (Spot Rate) $1 \leq = 772$ (6 months Forward Rate)			
Ans:	1\$ = ₹70 (Spot Rate)1\$ = ₹72 (6 months Forward Rate)\$ forward is > \$ Spot. : \$ is trading at premium.			
•	Premium (in amount) = $72 - 70 = ₹2$			
•	Premium (in %) = 2/70 = 2.86% For 6-month i.e. 5.72% p.a.			
Ex:	SR -> 1 \$ = ₹70			
	12-m FR -> = ₹77			
i)	Calculate premium of \$ and % of forward premium.			
ii)	Calculate discount of $ earrow$ and $ earrow$ of forward discount.			
Ans:	For \$ (Author Note - Consider price tag of \$ when calculating premium or discount of dollar)			
	\$ premium = 77 - 70 = 7			
	\$ premium % = <u>77 - 70</u> = 10%			

orex		10A.9	WWW.KRIVII.IN		
	For ₹ (Author Note - Consider price t	.ag of ₹ when calculating	premium or discount of rupee)		
	Spot rate of ₹ -> 1/70 = 0.0142857				
	12 months FR of ₹ -> 1/77 = 0.012987				
		-0.0012987			
		-9.09%			
	0.0142857				
	Author Note — The % of ₹ premium and	the % of ₹ discount is	not same.		
	Main reason — Change in base. Ex: 80 -> 100	is 25% increase, but 100 -	-> 80 is 20% decrease.		
	For exam — Students may assume forwar	d premium % = Discount	% (after giving a note)		
III)	CALCULATING FORWARD RATE USING PR	EMIUM OR DISCOUNT %			
	Sometimes in exam FR may not be given d	lirectly. Rather premium O	r discount % will be given.		
Ex:	Spot rate - 1 \$ = ₹80.				
	Find 3-m FR if \$ premium = 4% p.a.				
Ans:	3 months FR = SR + premium				
	= 80 (1 + 0.04 × 3/12) = ₹80.	8			
IV)	NOTES				
1.	Do not forget that 4% in above example	is '4% p.a.'.			
	So, premium for 3 months = 4% × 3/12 = 1	%			
2.	If premium or discount is not given in annualized form -> take premium or discount % as it is.				
	Ex: 3-m premium = 1%. Spot rate — 1\$ = ₹80				
	Now, this premium is already for 3 months. So, FR = 80 (1 + 0.01) = ₹80.8				
3.	If discount is given in ques, then it will of	course be subtracted fro	om the spot rate.		
V)	APPRECIATION VS DEPRECIATION				
•/	India won a cricket match against Pakistan	This means Dal	ristan lost the match.		
	THOR WOLL A CHERET MUTCH AGAINST FARISTAN	-> This means Pak			
-	(For 1 team to vin the other one much	1991			
-	(For 1 team to win, the other one must lo Similarly, if \$ is appreciating against ₹		ns that ₹ is depreciating against \$.		

VI)	SWAP POINTS	
	Swap points = Difference between FR & SR.	
Ex:	1FF = \$0.02493 \$0.02497 (SR)	
	<u>1FF = \$0.02496 \$0.02502 (FR)</u>	
	<u>Swap points = 0.00003 0.00005</u> → It is quoted as 3/5.	
	Notes:	
1.	Swap points are added or deducted from last decimal point in reverse order.	
2.	Swap points do not carry positive or negative signs.	
•	If swap points are in increasing order> It denotes PREMIUM > ADD it to SR to get FR.	
•	If swap points are in decreasing order> It denotes DISCOUNT > SUBTRACT it from SR to get FR	۲.
7.	Exam focused points related to Forward	
I)	CONTRACTED OR BOOKED RATE	
	The FINAL rate after considering exchange margin, commission etc. No further adjustment to be	do
II)	IDENTIFYING QUOTE

orex	10A.11 WWW.KRIVII.I
8.	ROI in case of Foreign Investment
I)	DOMESTIC INVESTMENT
•	In case of Domestic Investment, say in Nifty, an Indian Investor will get return on only Nifty.
*	No currency risk/return in case of Domestic Investment.
Ex:	Invested in Nifty at 10,000. Sold when Nifty at 10,500. Find return %.
Ans:	Return = 10,500 - 10,000 = 5%
	10,000
II)	FOREIGN INVESTMENT
•	In case of foreign investment, say where an Indian invested in S&P 500 Index, return will be earned on
	both investment & foreign currency. (Also risk on both, investment & forex).
Ex:	An investor invested in S&P 500 (US stock Index) when value of S&P was 2000. \$ at the time of investmen
	was ₹70/\$. He later sold his investment when S&P was at 2100. \$ at the time of selling was ₹71.4/\$.
	Find his total (effective) return on investment.
	Bifurcate this total return into return on foreign assets and return on foreign currency.
Ans:	METHOD 1> CONVERT IN HC & THEN CALCULATE
	Investment amount in ₹ = 2000 × 70 = 1,40,000
	Investment proceeds in ₹ = 2100 × 71.4 = 1,49,940
	Effective return = $1,49,940 - 1,40,000$ = 7.1%
	1,40,000
	Method 2> USING FORMULA METHOD
	Return on foreign asset (R_{FA}) = (2100 - 2000)/2000 = 5%
	Return on foreign currency (R_{FC}) = (71.4 - 70) / 70 = 2%
	Effective total return = $(1 + R_{FA})(1 + R_{FC}) - 1$
	= (1 + 0.05) (1 + 0.02) - 1 = 7.1%
Crux:	You can either use i) Direct method (i.e. convert in HC and then calculate return)
	ii) Formula method -> Effective return = (1 + RFA) (1 + RFC) - 1

Finance Acharya	Jatin	Nagpal	(CA,	FRM)
-----------------	-------	--------	------	------

	PART B: Exchange Rate Theories (PPPT, IRPT)
1.	Purchasing Power Parity Theory (PPPT)
	As per this theory, the price of a commodity in to different markets must be same.
	(Assuming no taxes, transaction cost etc.)
Ex:	You can buy a pen for \$20 today in US. The price of the same pen in India is ₹1000.
(i)	Calculate Implied Exchange Rate.
(ii)	Find forward rate of \$. If inflation in India is 5% p.a. & that in US is 2% p.a.
Ans :	Implied exchange rate> \$20 = ₹1000
	1 \$ = ₹50
	SR (₹/\$) = <u>Price in India (₹)</u>
	Price in US (\$)
ii)	After 1-year
	Price of pen in India after 1 year = ₹1000 × 1.05 = ₹1050.
	Price of pen in US after 1 year = \$20 x 1.02 = \$20.4
->	As per PPPT> \$20.4 = ₹1050
	1\$ = ₹51.47
	Hence, forward rate of \$ after 1-year = ₹51.47.
	or Directly → FR of ₹ = SR (1 + ₹ Inflation)
	\$ (1 + \$ Inflation)
II)	FORWARD PREMIUM AND DISCOUNT
,	Currency with higher inflation will be at discount and currency with lower inflation will be at premium.
	(Informal Tone – Jis country me Inflation kam, wo country achi. Uski currency premium pr hogi.)
III)	INTEREST RATE PERIOD
	If FR is to be calculated < 1 year -> (1 + inflation × months / 12)
	If FR is to be calculated > 1 year -> (1 + inflation) ⁿ

2.	Geographical Arbitrage
I)	TYPE 1 - When Bid — Ask rate of 2 banks are different such that -
	Selling rate of 1 bank is even less than the buying rate of another bank.
	For Arbitrage -> Buy low and sell
Ex:	\$ quotes are as follows:
	Bank A = ₹ 80 - 80.25
	Bank B = ₹ 80.50 — 80.75
Ans:	Here, Ask rate (selling rate) of Bank A > Bid rate (buying rate) of Bank B.
	Buy \$10,000 from Bank A = 10,000 × 80.25 = ₹8,02,500
	Sell \$ 10,000 to Bank B = 10,000 × 80.50 = ₹8,05,000
	Arbitrage profit = <u>₹2500</u>
	Profit per \$ = 2500/ 10,000 = ₹0.25
II)	TYPE 2 – TRIANGULAR ARBITRAGE
	Let us say you have ₹ and you want to buy \$.
	Method 1 — Directly go to bank and buy \$ (by giving ₹). (Informally we'll call it 'Direct market'
	Method 2 - Go to bank & buy say €. Now convert € to \$. (Informally - 'Indirect or cross market
	Now, in order to prevent arbitrage, cost of buying \$ in Direct and Indirect market should be same.
	If it is not same, then arbitrage is possible.
	For Arbitrage -> Buy low, Sell high.
Ex:	You can buy ¥ directly from Tokyo at ₹1.8/¥. Alternatively, you can also buy ¥ from US markets at
	¥140/\$. Construct arbitrage if ₹/\$ = ₹70. You have ₹14L which can be used for arbitrage purpose.
Ans:	Rate of ¥/₹ in direct market = ¥1.8
	Rate of ₹ in Indirect market → ¥/₹ = \$/₹ × ¥/\$ = 1/70 × 140 = ¥2
	☞ Price tag of ₹ in cross market = ¥2 (expensive)
	But price tag in direct market = ¥1.8 (cheap)
	∴ We must buy ₹ in direct market. & Then Indirectly sell in cross market at a higher rate.

Step 1.	Sell \gtrless Indirectly ($\gtrless \rightarrow \$ \rightarrow \$$)	
	Use \$20,000 to buy ¥ from US market = 20,000 x 140 = ¥28,00,000	
itep 2.	Buy ₹ directly in Tokyo against ¥ = 28,00,000 / 1.8 = ₹15,55,555	
	Hence, arbitrage profit = ₹15,55,555 — ₹14,00,000 = ₹1,55,555	
Ex:	If in the above example, if ₹/¥ is ₹2.2. Construct arbitrage (considering e	everything else is same)
Ans:	Now, price tag of ₹ in direct market (¥2.2) > Price tag in Indirect market	(¥2)
Ŧ	Sell ₹ in Direct market at higher price and Buy ₹ back from Indirect mark	et at lower rate.
Step 1:	Sell ₹ directly in market against ¥ = 14,00,000 × 2.2 = ¥30,80,000	
itep 2:	Buy ₹ indirectly (¥ \rightarrow \$ \rightarrow ₹)	
	Sell ¥30.8L and get \$ = 30,80,000 / 140 = \$22,000	
	Use \$22,000 to buy ₹ = 22,000 x 70 = ₹15,40,000	
	Arbitrage profit = 15,40,000 — 14,00,000 = ₹1,40,000	
3.	Interest Rate Parity Theory (IRPT)	
	Investment opportunities across different markets must be same.	
	An Indian investor wants to invest ₹70,000. He has 2 options.	
	Option 1 — Invest in India. Rf in India = 7% p.a.	
	After 1 year -> Investment proceeds = ₹70,000 × 1.07 = ₹74,900	
	Option 2 — Invest in US. US Rf = 3% p.a. Current exchange rate is ₹70/\$.	
	Amount invested today (in \$) = 70,000 / 70 = \$1,000.	
	After 1 year -> Investment proceeds = \$1000 × 1.03 = \$1030	
	As per IRPT, both opportunities should be same.	
	\$1030 = ₹74900	
	1\$ = ₹74,900> 1\$ = ₹72.72 (i.e. 1-year Forward rate of \$ should	d be ₹72.72).
	1030	

orex	10A.15 WWW.KRIVII.IN
	FR <u>₹</u> = <u>SR (1 + ₹ Rf)</u>
	\$ (1 + \$ Rf)
II)	INTEREST RATE PERIOD
	If FR is to be calculated < 1 year -> (1 + rf × months / 12)
	If FR is to be calculated > 1 year -> (1 + rf) ⁿ
Ex:	Spot rate - 1\$ = ₹80
	Interest rate in US = 4% p.a.
	Interest rate in India = 7% p.a.
i)	Calculate 6 months forward rate.
ii)	Calculate 3 years forward rate.
Ans:	$6m \ FR \ \underline{\cancel{2}} = \underline{SR (1 + \cancel{2} \ Rf \times 6/12)} = \underline{80 \times (1 + 0.07 \times 6/12)} = \cancel{3}81.176$
	\$ (1 + \$ Rf × 6/12) (1 + 0.04 × 6/12)
-	3 years FR ₹ = <u>SR (1 + ₹ Rf)</u> ³ = <u>80 × (1 + 0.07)</u> ³ = ₹87.125
	$(1 + Rf)^3$ $(1 + 0.04)^3$
III)	COVERED INTEREST RATE ARBITRAGE
	If actual forward rate + Eair forward rate then arbitrage is possible
	If actual forward rate \neq Fair forward rate then arbitrage is possible.
	If actual forward rate of base currency > Fair forward rate \rightarrow Invest in Base currency.
	If actual forward rate of base currency > Fair forward rate \rightarrow Invest in Base currency.
Ex:	If actual forward rate of base currency > Fair forward rate \rightarrow Invest in Base currency.
Ex:	If actual forward rate of base currency > Fair forward rate \rightarrow Invest in Base currency. If actual forward rate of base currency < Fair forward rate \rightarrow Invest in Other currency.
Ex: Ans:	If actual forward rate of base currency > Fair forward rate → Invest in Base currency. If actual forward rate of base currency < Fair forward rate → Invest in Other currency. Construct arbitrage if in above example, the prevailing 1-year forward rate is:
	If actual forward rate of base currency > Fair forward rate \rightarrow Invest in Base currency. If actual forward rate of base currency < Fair forward rate \rightarrow Invest in Other currency. Construct arbitrage if in above example, the prevailing 1-year forward rate is: Case $1 - ₹75/$$ Case $2 - ₹71/$$
	If actual forward rate of base currency > Fair forward rate \rightarrow Invest in Base currency. If actual forward rate of base currency < Fair forward rate \rightarrow Invest in Other currency. Construct arbitrage if in above example, the prevailing 1-year forward rate is: Case $1 - \frac{275}{\$}$ Case $2 - \frac{271}{\$}$ CASE $1 - \text{ACTUAL FORWARD RATE} = \frac{275}{\$}$.
	If actual forward rate of base currency > Fair forward rate \rightarrow Invest in Base currency. If actual forward rate of base currency < Fair forward rate \rightarrow Invest in Other currency. Construct arbitrage if in above example, the prevailing 1-year forward rate is: Case 1 - ₹75/\$ Case 2 - ₹71/\$ CASE 1 - ACTUAL FORWARD RATE = ₹75/\$. Since actual forward rate > Fair forward rate, So we'll invest in US and borrow from India.
	If actual forward rate of base currency > Fair forward rate → Invest in Base currency. If actual forward rate of base currency < Fair forward rate → Invest in Other currency. Construct arbitrage if in above example, the prevailing 1-year forward rate is: Case 1 - ₹75/\$ Case 2 - ₹71/\$ CASE 1 - ACTUAL FORWARD RATE = ₹75/\$. Since actual forward rate > Fair forward rate, So we'll invest in US and borrow from India. Today - Borrow ₹10,000 from India and Invest in US. \$ Invested = 10,000 / 70 = \$142.86
	If actual forward rate of base currency > Fair forward rate → Invest in Base currency. If actual forward rate of base currency < Fair forward rate → Invest in Other currency. Construct arbitrage if in above example, the prevailing 1-year forward rate is: Case 1 - ₹75/\$ Case 2 - ₹71/\$ CASE 1 - ACTUAL FORWARD RATE = ₹75/\$. Since actual forward rate > Fair forward rate, So we'll invest in US and borrow from India. Today - Borrow ₹10,000 from India and Invest in US. \$ Invested = 10,000 / 70 = \$142.86 After 1 year - \$ Investment proceeds = 142.86 × 1.03 = \$147.15
	If actual forward rate of base currency > Fair forward rate → Invest in Base currency. If actual forward rate of base currency < Fair forward rate → Invest in Other currency. Construct arbitrage if in above example, the prevailing 1-year forward rate is: Case 1 - ₹75/\$ Case 2 - ₹71/\$ CASE 1 - ACTUAL FORWARD RATE = ₹75/\$. Since actual forward rate > Fair forward rate, So we'll invest in US and borrow from India. Today - Borrow ₹10,000 from India and Invest in US. \$ Invested = 10,000 / 70 = \$142.86 After 1 year - \$ Investment proceeds = 142.86 × 1.03 = \$147.15 Convert this investment in ₹ at forward rate = 147.15 × 75 = ₹11,036.25

	<u>CASE 2 — ACTUAL FORWARD RATE = ₹71/\$.</u>	
	Since actual forward rate < Fair forward rate. So, we'll not invest in US. Invest in India & borrow	from U
	Today — Borrow ₹10,000 from US and Invest in India. \$ borrowed = 10,000/70 = \$142.86	
	After 1 year — Investment proceeds (from ₹ investment) = 10,000 × 1.07 = ₹10,700	
	Convert this investment in \$ at forward rate = 10,700 / 71 = \$ 150.70	
	Repay \$ loan = 142.86 × 1.03 = \$147.15	
	Arbitrage profit = 150.70 — 147.15 = \$3.55 or 3.55 × 71 = ₹252.05	
IV)	INTEREST RATES & FORWARD RATES - INVERSE RELATION	
	IRPT shows that currency and interest rates have INVERSE RELATION.	12.86
	(Informal Tone — Jis country me interest rate kam, us country ki currency premium pr hogi).	
4.	Premium Or Discount when Exchange Rates are not given	
	$FR \not\equiv / \not\equiv \frac{SR (1 + \not\equiv Rf)}{SR (1 + \not\equiv Rf)}$	
	(1 + \$ Rf)	
	$\underline{FR} = (1 + \overline{\xi} Rf)$	
	SR (1 + \$ Rf)	
	Subtracting by 1 on both sides-	
	$\underline{FR} - 1 = (\underline{1 + \overline{\xi} Rf}) - 1 \qquad \longrightarrow \underline{FR - SR} = (\underline{1 + \overline{\xi} Rf}) - 1$	
	SR (1 + \$ Rf) SR (1 + \$ Rf)	
	·····	
	Hence, premium or discount as per IRPT = <u>(1 + ₹ Rf)</u> — 1	
	(1 + \$ Rf)	
	Using similar logic, we can also say -	
	Premium or discount as per PPPT = $(1 + \underbrace{?} inflation) = 1$	
	(1 + \$ inflation)	
	Finally, we can say that -	
	Premium or discount = (1 + ₹ Rf) _ 1 = (1 + ₹ inflation) _ 1	
	(1 + \$ Rf) (1 + \$ inflation)	

Forex

	PART C: Netting, Lead, Lagging and MMO
1.	Netting (or Matching)
	We can Net our receivables & payables if following 2 conditions are met.
	Condition 1 — Receivables and payables must be in the SAME CURRENCY .
	Condition 2 — Receivables and payables must be standing at the SAME POINT OF TIME .
	In this section we will use various terms like 'Natural netting', 'Jugaad netting' and 'Artificial netting'
	These have been coined by the Author Finance Acharya Jatin Nagpal to make things easy & interesting.
	These are not Industry terms and hence should not be used in the exam.
	Short-form which we'll use extensively in this section -> R&P = Receivables and Payables.
I)	Scenario 1 - NATURAL NETTING (R&P are netted automatically)
	When R&P are in same currency and are standing at the same point of time. Netting happens naturally.
Ex:	\$ receivable after 1 year = \$4,00,000
	\$ payable after 1 year = <u>\$2,50,000</u>
	$\therefore \text{ Net exposure} = $1,50,000 (receivable)$
	Hence, \$2,50,000 is netted off. Net (balance) exposure left = \$1,50,000 receivable.
	Notes:
1.	Long vs Short exposure
•	Net \$ receivable = Long exposure.
	(Since we have \$ receivable. We will benefit if price of \$ increases. This is same as Long position)
•	Similarly, if Net \$ is payable, then we'll have net short exposure in \$.
• 2.	Similarly, if Net \$ is payable, then we'll have net short exposure in \$. We love Netting — Because Netting reduces our exposure without incurring much cost.

2.	Leading and Lagging			
I)	Scenario 2 - JUGAAD NETTING (R&P standing at d	ifferent time)		
-		on 1 satisfied.		
	But R&P are standing at different time \rightarrow Condition			
	For Netting> Lead (advancing) or Lag (postponing			
Ex:	Details of receivables and Payables	Forward rates on ${\tt f}$ are as	follows:	
	Receivable £15,000 after 3 months	3 months forward = ₹91/£		
	Payable £20,000 after 4 months	4 months forward = ₹92/£		
	Should you Lag your receivables if interest rates in	India is 6% p.a. No interest is	earned on £ investmer	
Ans:	Here, we have 2 options.			
	Option 1 — Lag receivables by 1 month to Net the $R\&P$.			
	Net R&P (£15,000) and obtain forward cover for only	y balance £5,000.		
	Amount paid under forward after 4 months = 5,000 × 92 = ₹4,60,000.			
	Option 2 — Do not Net R&P. Obtain separate forward covers for both R&P.			
	After 3 months - Convert £15,000 ₹ = 15,000 × 91 =		₹13,65,000	
	Invest it for 1m. Investment proceeds = 13,65,000 (1	1 + 0.06×1/12) =	₹13,71,825	
	Pay £20,000 payable at FR = 20,000 × 92 =		₹18,40,000	
	Net cost under option 2 = 18,40,000 — 13,71,825 =		₹4,68,175	
-	Hence, it is advisable to lag receivables and net the	exposure as it is leading to lo	wer cost.	
II)	MECHANICS OF LEADING			
	Generally discount is offered for early payment. Hence, in case of leading -			
	Gross receipt / payment (-) Discount			
III)	MECHANICS OF LAGGING			
	Lagging receivable -> Interest maybe received on F(C balance.		
	Lagging payable -> Interest charged by supplier/lend	ler for late payment. Net payr	nent = Gross + Interes	

3.	Scenario 3 – ARTIFICIAL NETTING (MMO)	
	Problem — Sometimes only receivable or Payable is present. There is No	counter exposure to Net.
	Solution - ARTIFICIALLY CREATE opposite exposure to make netting	g possible.
Ex:	You have $\mathbf Y$ receivable after 3 months. But no $\mathbf Y$ payable whatsoever.	
	Netting = Not possible 🗙	
Ans:	Borrow today for 3m from Japan (in ¥). Convert this amount into ${\mathfrak T}$ t	oday only.
	After 3 months> use \mathbf{X} receivable to pay off the \mathbf{X} borrowing. Hence	e, no forex exposure at all.
-	Similarly, if you have $\mathbf a$ payable, then invest today in $\mathbf a$. Later use this in	nvestment to pay the payable.
11)	IMPORTANT NOTES	
1.	Concept - If you have payable in FC, then artificially create receivable t	today by investing in FC.
	If you have receivable in FC, then artificially create payable t	oday by borrowing in FC.
2.	Period of investment or borrowing = Should be equal to period of rece	ivable or payable.
3.	How much to invest or borrow? = PV of receivable or borrowing.	
ч.	Fancy name of Artificial Netting = 'Money Market operations (MMO)'	
5.	In ques, always calculate future value of amount paid or invested toda	ay.
6.	More than 1 interest rate is given in ques -> Lower rate = Investment r	rate , Higher rate = Borrowing rate
III)	MMO IN CASE OF EXPORTER	
Ex:	You have receivable £20,000 after 6 months. Illustrate how you can he	edge this exposure if:
	Spot rate — £1 = ₹90.	
	Interest rates in — India = 5% p.a. and UK = 2% p.a.	
Ans:	(Thought process -> Only receivable is there. So, artificially create a pay	jable for Netting).
		C10 901
-	Borrow PV of £20,000 today from UK = $20,000$ =	£19,802
	$(1 + 0.02 \times 6/12)$	
-	This borrowing will be later netted off with the £20,000 receivable.	
	Convert £19,802 into ₹ at spot rate = 19,802 × 90 =	₹17,82,180
-	Future value of ₹17,82,180 = 17,82,180 (1 + 0.06 × 6/12) =	₹18,35,645.4

IV)	MMO IN CASE OF IMPORTER	
Ex:	You have \$40,000 payable after 4 months. Illustrate how you can hedge this exposure if:	
LA.	Spot rate - 1\$ = ₹80.	
	Interest rates in - India = 6% p.a. and US = 3% p.a.	
Ans:	(Thought process -> Only payable is there. So, artificially create a receivable for Netting).	
-	Invest PV of \$40,000 today in US =40,000 = \$39,604	
	(1 + 0.03 × 4/12)	
-	This investment will be later netted off with the \$40,000 payable.	
-	This \$39,604 will be borrowed today in ₹ = 39,604 × 80 = ₹31,68,320.	
-	After 6 months -> Repay borrowing = 31,68,320 (1 + 0.06 × 4/12) = ₹32,31,686.4	
	Hence, total cost under MMO = ₹32,31,686.4	

Forex

PART D: Fate of forward contracts

1.	Fate of forward contracts			
	Importer -> Buys forwards (i.e. Importer agrees to buy FC in future from bank).			
	Exporter -> Sells forwards (i.e. exporter agrees to sell FC in future to bank).		bank).	
	Different scenarios may arise after the contract is entered.			
	DELIVERY	CANCELLATION	EXTENSION	
	i) Early delivery (Technical)	i) Before date - Square off	i) Before due date — Square off	
	ii) Delivery on due date — Simply	ii) On due date — Square off	existing contract + Enter new	
	buy or sell FC at agreed rate.	iii) Late cancellation — Technical	ii) On due date _ Square off	
	iii) Late delivery — Technical		existing contract + Enter new	
			iii) Late extension — Technical	
II)	DELIVERY ON DUE DATE			
	Simply buy or sell FC at agreed rat	e (literally nothing special to be dor	ne).	
Ex:	Importer -> forward buy £5,000 a	t ₹92/£. Find his ₹ outflow if he rec	uests bank to deliver £ on due date.	
Ans:	Outflow = £5,000 × 92 = ₹4,60,000.			
III)	CANCELLATION			
1.	To cancel -> One must SQUARE OF	F the contract.		
	Squaring off a forward contract -	– Take opposite position to square (off.	
	If earlier Bought forward -> Then	sell forward to square off.		
	If earlier Sold forward -> Then Bu	y forward to square off.		
2.	Squaring off is done with contrac	t of same maturity.		
	Ex: On 1 April, Importer bought a	forward contract to buy \$1L. Cont	ract maturity = 30 June.	
	Later on 31 May, importer wants t	o cancel (square off) this contract.	To do so, he must now sell a	
	FORWARD WITH SAME MATU	JRITY (i.e. 30 June). So, sell 1-month	forward on 31 May to square off.	
3.	On Due date — Forward rate = Spc	ot rate (as per principle of converge	ence).	

Finance Acharya Jatin Nagpal (CA, FRM)

10A.22

IV)	EXTENSION				
1.	A forward contract cannot be extended as such. If you want to extend, then				
	1 st Cancel (square off) existing contract. Then enter into a new contract of desired maturity.				
V)	CANCELLATION FEE				
	Bank may charge a fixed cancellation fee. If any such fee is given in ques, then customer must bear	r it			
VI)	CRUX				
1.	Following 4 cases are almost same -				
	a) Cancellation before due date c) Extension before due date				
	b) Cancellation on due date d) Extension on due date				
	All these cases include 'squaring off existing contract'. In extension, a new contract is also entered	ed.			
2.	Early delivery				
	As per FEDAl* guidelines -> bank must deal with a customer even if customer shows up early.				
	* FEDAI = Foreign Exchange Dealers Association of India				
	Amount payable / receivable by customer under Early delivery				
1.	Amount payable / receivable at contracted forward rate xxx	x			
2.	Swap loss Importer = Spot Buy & sell forward xxx	×			
	(or gain) Exporter = Spot Sell & Buy forward xxx	×			
3.	Interest cost (Note below) = (Outflow – Inflow) × Interest% × No. of days /365 $\times \times \times \times$	×			
	Net payable or receivable = <u>xxx</u>	x			
	<u>Understanding inflow & outflow - For exporter</u>				
	Exporter showed up earlier and bank has to purchase FC from him at contracted rate.				
	But bank will not keep this FC purchased with itself. Rather it will sell it at prevailing Spot rate in IBM*.				
	Hence,				
	Bank outflow = FC purchased from exporter @ contracted rate.				
	Bank Inflow = FC sold in Inter-bank market (IBM) @ Spot rate.				
	<u>Understanding inflow & outflow - For Importer</u>				
	Importer showed up earlier and bank has to sell FC to him at contracted rate.				
	But bank itself has to buy this FC from IBM at Spot rate.				

Forex	10A.23	WWW.KRIVII.IN			
	Bank outflow = FC purchased from IBM @ Spot rate.				
	Bank inflow = FC sold to importer @ Contracted rate.				
	Notes:				
1.	Swap gain (if any) or Interest cost gain will also be passed on to customer in case o	of early delivery.			
2.	Exchange margin is not applicable in case of Inter-bank market transactions.				
3.	When bank is selling in IBM -> Other dealer (Bank) is buying. Hence, Bid rate will be app	olicable.			
	Similarly when Bank is buying from IBM -> Other dealer (Bank) is selling. Hence, Ask ra	te will be applicable.			
3.	Late Delivery / Cancellation / Extension				
	If customer does not show up on maturity date, then the contract shall be cancelled either on the date				
	the customer comes or within 3 working days after the maturity date.				
	However, the customer must pay following charges.				
æ	GAIN IF ANY WILL NOT BE PASSED ON TO CUSTOMER IN THIS CASE.				
	Amount payable / receivable by customer under Early delivery				
1.	Cancel (square off) contract at SR prevailing on the date on which customer shows	up xxx			
2.	Swap loss Importer = Spot Sell & Buy forward	xxx			
	(or gain) Exporter = Spot Buy & Sell forward	xxx			
3.	Interest cost (Note below) = (Outflow $-$ Inflow) x Interest% x No. of days /365	xxx			
	Net payable or rea	ceivable = <u>xxx</u>			
*	Extension in this case — As discussed earlier, forward contract cannot be extended	as such.			
	Rather a new contract must be entered for new desired date.				

PART E: Forex Decisions Credit, Hedge, Int. cash mgt

1.	Forex Decisions – Avail credit or not?
	Sometimes supplier gives the importer a credit period (say 60 days, 90 days etc.).
	In such cases, importer has 2 options.
	Option 1 — Avail the credit period and enter into a forward contract.
	Option 2 — Borrow from the local bank today and pay the supplier today.
	A discount is generally given by supplier for early payment.
	Interest on loan from local bank is paid.
	Cash balance (if any) should be subtracted from the loan amount.
2.	Forex Decisions – Hedge or not?
	Suppose you have a FC receivable or payable. Now, you can hedge this exposure or leave it unhedged.
	In such cases, we'll calculate Expected loss or gain under both the scenarios.
i)	Is hedging beneficial?
-	Calculate amount at forward rate.
-	Calculate amount at ACTUAL spot rate prevailing on the settlement date.
	Compare the 2 and find if hedging was beneficial.
ii)	Profit and loss under hedging
	P&L (today) due to hedging = Amount at forward rate vs Amount at EXPECTED SPOT RATE
iii)	Expected loss
	Expected loss = Difference between amount paid (or received) at Expected SR and at current prevailing SR.
3.	International Investment decision
Ex:	let us say that Sweet Chilly Itd. (SCL) has offices at multiple locations — US, Germany, Australia etc.
	The Head office is in US. It has some surplus funds (in \$) which its wants to invest for 2 months.
	Determine where funds should be invested.

Forex	10A.25	WWW.KRIVII.IN		
Ans:	: Calculate closing value of investment in \$ at each location. The one with max. value will be chosen.			
Step 1	Investment in FC (Germany & Australia) $=1^{ m st}$ convert ${f \$}$ balance into FC at sp	oot rate.		
	At the end — Convert balance in foreign currency into \$ using forward rate.			
Step 2	Investment in US — Balance is already lying in \$. So no hassles. Directly calcula	te closing investment value.		
	Examiner Twist 1 - Surplus funds lying in US but are not in \$. Be extra caut	ious in such case.		
Ex	Surplus funds are lying in US in ₹. Then even while investing in US, first ₹ balan	nce will be converted into		
	\$ at spot rate. (same procedure as above).			
	Examiner Twist 2 - Stay alert regarding the currency in which closing invest	ment is to be calculated.		
	If specifically given in ques -> Then choose that currency.			
	If nothing specific given in ques -> Chose currency in which surplus balance is	currently lying.		
	International Perrowing decision			
4.	International Borrowing decision This is exactly opposite of international investment decision.			
	In the above ex, say SCL wants to borrow funds in \$. Again, it has 3 options -	US Germany and Australia		
Ans:	Calculate \$ outflow under each location. It will borrow from the location which			
Step 1:	Borrowing in FC (Germany & Australia) - Calculate amount to be borrowed in			
	In the end - Convert balance in FC into \$ using forward rate.			
Step 2:				
5.	International Cash management			
0.				
Ex:	MNC with office in London, India and Tokyo. Head office in India. Cash balance	of each office is as below-		
	London = Surplus £5 Lacs			
	India = Surplus ₹300 Lacs			
	Tokyo = Deficit ¥200 Lacs			
	Two options			
	OPTION 1 - INDEPENDENT CASH MANAGEMENT			
Step 1:	London & India invests its surplus funds locally and Japan will borrow required			
Step 2:	Calculate closing value = convert all the balance in country's HC using forward rate.			

	OPTION 2 - POOLING METHOD				
	London, India & Japan will all pool their funds at Head office in India.				
Step 1:	Convert all the FC at spot rate in Home currency.				
Step 2:	Calculate Net surplus or deficit after pooling.				
	If Net surplus -> Invested at HC rate.				
	If Net deficit -> Borrowed from HC.				
Step 3:	Calculate closing value = Amount Invested (or borrowed) + Interest				
	Compare the closing value under both the alternatives and chose the more advantageous one.				
	When withholding tax is given				
	Effective interest rate on borrowing = Interest rate required by foreign bank				
	1 — withholding tax rate				
	Effective interest rate on investment = Interest paid by foreign bank x (1 $-$ withholding tax)				
	Any other cost				
	Some other costs such as servicing fee etc. may be given in ques.				
	It will increase our borrowing cost (or decrease our investment value).				
	If Exchange rates are not given in ques				
	Calculate the interest cost in foreign currency = Interest cost + servicing cost etc.	xxx			
±	Premium (or discount) of foreign currency	xxx			
	Net interest cost =	xxx			
Ex:	Cal. premium (or discount) when exchange rates are not given				
	Germany (€) = 5% p.a.				
	US (\$) = 4% p.a.				
Ans:	As per IRPT -> \$ premium (or Discount) = $1 + \in Rf - 1 = 1.05 - 1 = 0.96\%$				
	1 + \$Rf 1.04				

orex		10A.27	WWW.KRIVII.IN		
			Other topics - Nostro-Vostro Forex exposure		
1.	Cash A/c and Exchang	ge position A/	C		
I)	CASH ACCOUNT (NOSTRO ACCO	UNT)			
	This is just like your old school 'Ca	ish book' account	→ Debit — when you actually purchase FC.		
			Credit — When you actually sale FC.		
II)	EXCHANGE POSITION ACCOUNT				
	This is an 'EXPOSURE ' account.	→ Long exposure =	Positive (Add)		
		Short exposure	= Negative (Subtract)		
Ex:	Bought \$20,000 in cash market. Sold forward on \$15,000.				
	Find balance in cash account and in	n exchange position ac	count.		
Ans:	Particulars	Cash A/c f	xchange position A/c		
	Bought \$	20,000	20,000		
	Sold \$ forward		(15,000)		
	Balance =	\$ 20,000	\$ 5,000		
III)	SOME ITEMS WORTH CONSIDERING				
	Particulars	Impact on Cash acco	unt Impact on Exchange position A/C		
	Purchased spot FC	Add	Add		
	Sold Spot FC	Subtract	Subtract		
	Purchased forward on FC	×	Add		
	Forward purchased cancelled	×	Subtract		
	Sold forward on FC	×	Subtract		
	Forward Sold cancelled	×	Add		
	DD on FC issued but not yet paid	×	Subtract		
	Draft on FC cancelled	×	Add		
	Purchased DD / bill on FC	×	Add		
	Purchased DD / bill cancelled	×	Subtract		
	Cheque purchased but not credited	× ×	Add

Forex

IV)	BALANCE INTERPRETATION			
	Cash (Nostro) Account	Exchange position Account		
	Credit balance = Positive	Over-bought = Positive		
	Debit balance = Negative	Over-sold = Negative		
V)	MANAGING CLOSING BALANCE			
	Often in ques we are given the 'required'	closing balance of cash account and Exchange position account		
	In such cases -			
Step 1:	Achieve required closing balance of 'Cash	A/c' by buying or selling spot.		
	(This buying or selling will also impact exc	hange position account)		
Step 2:	Achieve required closing balance of 'Exch	ange position A/c' by buying or selling forward.		
VI)	TT - TELEGRAPHIC TRANSFER			
	Telegraphic transfer is a method to buy or sell FC.			
	So, if Purchased TT -> Means bought FC spot			
	Sold TT -> Means sold FC spot			
	Purchased 3m forward TT -> Purchased forward contract and so on			
VII)	NOSTRO, VORO & LORO ACCOUNTS			
	(These are just fancy Italian names)			
	Nostro — Our account with you			
	Vostro - Your account with us			
	Loro — Their account with you			
	WHAT DOES IT MEAN?			
Ex:	SBI has a bank account with JP Morgan Chase in US. All the \$ buy and sell SPOT transactions of SBI			
	happens through this account. So, this is simply a cash account of SBI maintained in $\$$.			
	WHY SUCH FANCY NAME?			
	SBI communicating with JPMC -> Referring to its \$ A/c -> Use term 'Nostro A/c' (our A/c with you)			
	JPMC communicating with SBI -> Referring	g to SBI's \$ A/c -> Use term 'Vostro A/c' (your A/c with us)		
	PNB communicating with JPMC -> Referring to SBI's \$ A/c -> Use term 'Loro A/c' (their A/c with you)			

orex		10A.29	WWW.KRIVII.I		
2.	Forex exposure				
I)	TRANSACTION EXPOSURE				
		due to exchange rate flu	ctuations on transactions which were		
	entered BEFORE THE EXCHANGE	5			
	Tyn evnosure - Net inflou / ou	tflow at SP (-) Net in	flow / outflow at settlement date		
Ex:	Purchased goods today worth \$1000.	Payment to be made in 3	months. Find transaction exposure if -		
	SR — 1 \$ = ₹ 79				
	Expected rate after 3 months — 1 $\$$ =	₹80			
Ans:	₹ outflow at spot	= 1000 × 79 =	₹79,000		
	Expected ₹ outflow after 3 months	= 1000 × 80 =	₹80,000		
		Transaction expo	sure = <u>₹1000</u>		
II)	ECONOMIC or OPERATING EXPOSURE				
	It refers to the extent to which the economic value of a company can decline due to changes in				
	exchange rate. It is the overall impact of exchange rate changes on the value of the firm.				
	exchange rate. It is the overall impact of exchange rate changes on the value of the firm.				
	P&L due to operating exposure = Profit at SR (-) Profit at changed rate at new demand				
Ē	% change in demand = - % change	price x Price elasticity o	fdemand		
III)	TRANSLATION EXPOSURE (Account	ing exposure)			
	It refers to gains or losses caused by the translation of foreign currency assets and liabilities into the				
	currency of the parent company for consolidation purposes.

	Student's Space		

Chapter 10B **Currency F&O Chapter Index** PART A - Basics of Forex PART B - Currency Options ---- Student's Space for Summary chart and notes ----

Т

	PART A: Basics of Forex		
	(as the name indicates, it is strongly advisable to first revise 'Futures' before this part.)		
1.	Currency Futures – Basics		
I)	IDENTIFYING FUTURES CURRENCY		
Ex:	Interpret following futures contract quotes -		
a.	1 Ashok Leyland = ₹150		
	- It means futures contract on Ashok Leyland.		
	- Gain / loss will be in ₹ terms		
þ.	1 \$ = ₹80. Contract size = \$1000.		
	- It means futures contract on \$.		
	- 1 Contract is for 1,000 \$		
	- Gain / loss will be in RS. TERMS .		
	- If 5 contracts entered, and gain = ₹2. Then total gain = 2 x 5 x 1000 = ₹10,000		
C.	1 ₹ = 0.0125 \$. Contract size ₹50,000.		
	- It means futures contract on ₹		
	- 1 Contract is for 50,000 RS .		
	- Gain / loss will be in \$ TERMS .		
	- If 3 contracts entered and gain = $\$0.0004$. Then total gain = $0.004 \times 3 \times 50,000 = \600 .		
Crux:	Futures contract is on the L.H.S currency.		
	For ex — If 1₹ = 0.0125\$, then it is futures contract of ₹ (in \$ terms).		
	We will informally call the futures contract currency as 'FUTURES CURRENCY.'		
II)	WHETHER TO LONG OR SHORT FUTURES?		
	First correctly identify the 'futures currency' using above logic.		
	If you want to buy 'Futures currency' in future -> Then Buy (long) futures.		
	If you want to sell 'Futures currency' in future -> Then Sell (short) futures.		
	(same normal futures logic).		

PRINCIPLE OF CONVERGENCE				
At maturity — Futures rate = Sp	ot rate	(for logic — Refer Derivatives Futures		
NUMBER OF CONTRACTS				
Number of contracts = <u>Total exp</u>	DOSURE IN FUTURES CURR	ENCY		
Co	intract size (or lot size)			
When Exposure curr	<mark>ency = Futures cur</mark>	rency (1		
In this case future contract is d	irectly given on the currency	which we want to buy or sell in future.		
\$4,00,000 receivable after 3 mont	ths.			
3-months futures quote -1 =	₹45.			
Lot size = \$ 1,000.				
Analyse the action that should by	e taken today.			
Gain or loss on futures if Future	s rate on maturity = ₹44.50.			
Net realization per \$.				
(Both futures currency and exposure are in same currency. Hurray!!! No worries.)				
Whether to long or short future	<u>28?</u>			
We will receive \$ after 3-months	s and will SELL IT to get ₹.	Hence, sell (short) futures.		
Number of contracts to short				
Number of contracts = Total exp	osure in futures currency	= <u>4,00,000</u> = 400 contracts.		
Со	intract size (or lot size)	1,000		
<u>Gain or loss</u>				
Sold futures at = ₹4	5/ \$			
Bought futures at = <u>₹</u> 4	<u>4.5/\$</u>			
Gain / (loss) = <u>₹0</u>	<u>).5/\$</u>			
Total gain = ₹0.5 × 1000 × 400 = ₹	2,00,000			
Net realisation per \$				
· · · · · · · · · · · · · · · · · · ·	0,000 × 44.5 ₹1,78,00),000		
Gain on future square off :	₹2,00,0	00		
	NUMBER OF CONTRACTS Number of contracts = Total exp Co When Exposure curr In this case future contract is d \$4,00,000 receivable after 3 months 3-months futures quote -1 \$ = Lot size = \$1,000. Analyse the action that should b Gain or loss on futures if Future Net realization per \$. (Both futures currency and expo Whether to long or short future We will receive \$ after 3-months Number of contracts to short Number of contracts to short Number of contracts = Total exp Co Gain or loss Sold futures at = ₹4 Bought futures at = ₹4 Bought futures at = ₹4 Met realisation per \$ Sale \$4,00,000 at spot rate : \$4,0	At maturity – Futures rate = Spot rate NUMBER OF CONTRACTS Number of contracts = <u>Total exposure</u> IN FUTURES CURR Contract size (or lot size) When Exposure currency = Futures cur In this case future contract is directly given on the currency \$4,00,000 receivable after 3 months. 3-months futures quote -1 = ₹45. Lot size = \$1,000. Analyse the action that should be taken today. Gain or loss on futures if Futures rate on maturity = ₹44.50. Net realization per \$. (Both futures currency and exposure are in same currency. Hu Whether to long or short futures? We will receive \$ after 3-months and will SELL IT to get ₹. <u>Number of contracts to short</u> Number of contracts = <u>Total exposure</u> in futures currency Contract size (or lot size) <u>Gain or loss</u> Sold futures at = <u>₹45/\$</u> Bought futures at = <u>₹45/\$</u> Total gain = ₹0.5 × 1000 × 400 = ₹2,00,000		

3.	When Exposure currency ≠ futures currency (2a &				
	In this case, exposure will be in different currency and futures contract will on other currency.				
	In such cases, we'll have to take care of 2 things.				
Ex:	\$20,000 receivable after 2 months. But futures contract is given on ₹.				
	2-months futures quote — ₹1 = \$0.0125. Lot size = ₹50,000.				
	CARE 1				
	1 st we need exposure in futures currency.				
	Convert exposure in futures currency USING FUTURES RATE = \$20,000 / 0.0125 = ₹16,00,000.				
	Number of contracts = Total exposure in futures currency = 16,00,000 = 32 contracts.				
	Contract size (or lot size) 50,000				
	CARE 2				
	Gain or loss on futures will be in \$. This will affect our Net \$ receipt.				
	For ex — If loss on futures = \$700, then net \$ received = \$20,000 - \$700 = \$19,300.				
	Convert this net receipt (or payment) into HC at prevailing spot rate.				
Ex:	€2.8 Million receivable after 6 months.				
	6-months Futures contract is currently trading at €1.1943/£. Contract size = £62,500. Find				
i)	Number of contracts to be traded. Round off to nearest whole number.				
ii)	Net f received after 6-months, if spot rate after 6-months turns out to be f 1.1873/ f .				
Ans:	(Here, exposure is in € but futures currency = £)				
i)	Thought process> \in is receivable. So, we will sell \in after 6 months and buy £. So, buy £ futures.				
	Number of contracts to short				
	Total exposure in futures currency = <u>€ 2.8 Million</u> = <u>£</u> 23,44,470				
	1.1943				
	Number of = Total exposure in FUTURES CURRENCY = 23,44,470 = 37 contracts (nearest whole number				
	contracts Contract size (or lot size) 62,500				
ii)	After 6-months, Gain/(Loss) on futures contracts				
	Buy futures = € 1.1943 / £				
	Sell futures = <u>€ 1.1873 / £</u>				
	Gain/(loss) = <u>(€0.0070) / £</u>				
	Total loss = € 0.0070 × 37 × 62500 = € 16,187.5				

urren	cy FŧO	10B.5	WWW.KRIVII.IN	
-	Net f realization after 6-months :			
	Receive € 2.8 Million € 28,	00,000		
(-)	Loss on futures <u>€ 16,1</u>	187.5		
=	Net € received <u>€ 27,</u>	83,812.5		
	Equivalent <u>f</u> = 27,83,812.5 / 1.1873 =	£2.3447 Million		
4.	Margin money in currency	<mark>y futures</mark>	(3a & b)	
-	Remember — Margin money is just like a r	refundable security	y deposit. So, Initial margin paid is NOT cost as	
	such. Only the interest cost incurred on	Initial margin will	be treated as cost.	
Ex:	\$3,00,000 receivable after 3 months i.e. c	on 1 July.		
	July currency futures are trading at -1	₹ = \$0.0151		
	Lot size of futures = ₹6,40,000. Initial ma	argin required = ₹2	4,000. Interest rate in India is 8.5% p.a.	
	Find net realisation in ₹ if on 1 July the f	futures rate is \$ 0.	0147.	
Ans:	\$ is receivable. So, we will sell \$ after 3 months and buy ₹. So, buy ₹ futures.			
-	No. of contracts = <u>3,00,000/0.0151</u> = 31.04 i.e., 31 contracts			
	6,40,000			
-	Initial margin paid = 31 × 24,000 =		₹7,44,000	
-	Interest cost on initial margin = 7,44,000	× 8.5% × 3/12 =	₹15,810.	
-	Gain/(loss) on futures or Variation margi	n calculation		
	Bought Futures :	\$ 0.0151		
	Sold Futures :	\$ 0.0147		
	Gain/(loss) =	<u>(\$0.0004)</u>		
	Total Loss = \$0.0004 × 31 × 6,40,000 =	\$ 7,936.		
	Net realization under futures :			
	Receive	\$ 3,00,000		
(-)	Loss on futures	<u>(</u> \$7,936)		
=	Net \$ receipt	\$ 2,92,064		
	Equivalent ₹ (Using SR = \$0.0146/₹)	₹2,00,04,384		
(-)	Interest on initial margin =	(15,810)		
	Net ₹ receipt =	₹1,99,88,574		

PART B: Currency Options

1.	Currency options – Basics
I)	BASIC RECALL
	Call option = Right to BUY at strike price
	Put option = Right to SELL at strike price
II)	IDENTIFYING OPTIONS CURRENCY
	(same as identifying futures currency)
Ex:	Interpret following option contract quotes -
a.	Call option on \$ at strike = ₹80. Contract size = \$1000.
	- It means option contract on \$ at strike price of ₹80.
	- Call option means 'Right to Buy' i.e. we'll have right to buy \$ at ₹80/\$.
	- 1 Contract is for 1,000 \$
	- Premium will be paid in RS.
þ.	Put option on ₹ at strike price of 0.0125\$. Contract size ₹50,000.
	- It means option contract on \gtrless at strike price of \$ 0.0125.
	- Put option means 'Right to Sell' i.e. we'll have right to sell ₹ at \$0.0125.
	- 1 Contract is for 50,000 RS .
	- Premium will be paid in \$ TERMS.
crux:	Options contract is on the L.H.S currency.
	We will informally call the options contract currency as 'OPTIONS CURRENCY.'
II)	WHETHER TO BUY CALL OPTION OR PUT OPTION.
	First correctly identify the 'Options currency' using above logic.
	If you want to buy 'Options currency' in future -> Then Buy Call option (Right to Buy).
	If you want to sell 'Options currency' in future -> Then Buy Put option (Right to Sell).

ren	cy FŧO	10B.7	WWW.KRIVII.IN
III)	OPTION PREMIUM IS COST		
	The premium paid today for purchasing o	ption is a 'cost' for the b	puyer.
	Also, since option premium is paid today (i.e. at the time of entering	g contract) so interest cost is also
	incurred on the option premium paid.		
	Total cost of option = Premium paid	l today + Interest cost	t on premium
IV)	NUMBER OF CONTRACTS		
	Number of contracts = Total exposure	I OPTIONS CURRENC	y
		ze (or lot size)	
V)	UNHEDGED PORTION		
	Exposure left unhedged (due to option lo	t size) is usually hedged wit	th forward contract.
Ex:	\$42,000 receivable. 1 option contract is fo	or \$ 5,000.	
	Buy 8 Put options contracts. Exposure co	vered via options = 8x5000) = \$40,000.
	For balance \$2,000 enter forward contrac	St.	
VI)	NET AMOUNT RECEIVED OR PAID IN CAS	SE OF CURRENCY OPTION	IS
	Amount received or paid under currency	options	xxx
(+)	Option premium paid		xxx
(+)	Interest cost on option premium paid		XXX
(+)	Unhedged portion covered via forward co	ntract	XXX
	Τ	otal amount received =	xxx
2.	When Exposure currency	= Options curren	<mark>Cy</mark> (5)
	In this case option contract is directly give	•	-
Ex:	Amount payable in 1 month = Cad \$10,10,0	00	
	Call & put options on Cad \$ are available	with at a strike price of $\$$.0.94 and lot size = Cad \$ 50,000.
	Option premium — Call = 0.0102 \$	Put = 0.0101	\$
i)	Determine whether you should buy call op	ption or put option.	
ii)	Determine number of contracts to be bo	ught.	
:::>	Total cost or total \$ outflow if balance	amount is purchased at \$	0.93 per Cad \$.
iii)			· · · · ·

ii)	Acharya Jatin Nagpal (CA, FRM)	10B.8	Currency F&
	Number of = Total exposure in OPTIONS CURRENCY =) contracts (rounded off)
	contracts Contract size (or lot size)	50,000	
-	Option contract is entered for 20 x 50,000 = Cad \$ 1	0,00,000.	
-	Balance Cad\$ 10,000 will be purchased at forward rat	e of \$0.93/Cad \$	5.
_	Option premium paid today = 10,00,000 × 0.0102 = \$10,	,200	
iii)	Total cost or Total \$ outflow		
	Cad \$ purchased under options = 10,00,000 × 0.94 =	\$ 9,40,000)
	Cad \$ purchased under forward = 10,000 × 0.93 =	\$ 9300	
	Option premium paid = \$10,200 =	\$ 10,200	
	Total c	.ost = \$ 9,59,525	.5
3.	When Exposure currency ≠ Optio	ns currenc	y (u
	Take care of 2 things:		
	1. Convert exposure into Options currency for the p	urpose of calcula	ating number of contracts.
	2. The premium paid in FC should be converted into h	IC at prevailing S	pot rate.
Ex:	¥5,00,000 payable in 3 months. Currency option on ₹	is available with	following details:
Ex:		is available with	following details:
Ex:	Strike Price JY2.125	is available with	following details:
Ex:	Strike PriceJY2.125Call Option (June)JY0.047	is available with	following details:
Ex:	Strike PriceJY2.125Call Option (June)JY0.047		following details:
	Strike PriceJY2.125Call Option (June)JY0.047Put Option (June)JY0.098	o / 1.9711	
Ex:	Strike PriceJY2.125Call Option (June)JY0.047Put Option (June)JY0.098Currently, the prevailing spot rate is1 ₹ = ¥1.9516	9 / 1.9711 ≨. It is given on ₹	τ
	Strike PriceJY2.125Call Option (June)JY0.047Put Option (June)JY0.098Currently, the prevailing spot rate is $1 \neq = \$1.9516$ Exposure in $\$$. But currency option is not given on $\$$	9 / 1.9711 ≨. It is given on ₹	τ

It is given on ₹ re'll sell ₹. Hence, ₹2,35,294	τ.

urren	cy FŧO	10B.9	WWW.KRIVII.IN
iii)	Total ₹ outflow under options		
	At max. amt payable under put = 5,00,0	00 / 2.125 =	₹2,35,294
	Put premium (in ₹)	=	₹11,815
	Toł	al ₹ outflow =	₹2,47,109
II)	CALCULATING UNHEDGED PORTION		(ד)
-	When exposure currency = Options curr	ency> Total	exposure (-) Amount covered via options
	When exposure currency ≠ Options cur	rency> Total	exposure (-) Amount of options x Strike price
Ex:	Payable \$3,64,897 in 6-months. Currency	options are av	ailable. Details are as under -
	Strike price = \$1.70/£	Lot size :	= £12,500
	Call premium = \$0.037	Put prem	ium = \$0.096
	Spot rate = \$1.5617 - 1.5673	6 month	's forward rate = \$1.5455 — 1.5609
Ans:	Since \$ is payable, so we'll need to pure	chase \$ i.e. we'	'll sell £. Hence, buy put option on £.
ii)	Exposure in options currency (in f) =	<u>3,64,897 / 1.70</u>	= £214,645
		1.70	
	Number of = Total exposure in OPTIONS	CURRENCY =	214,645 = 17 contracts (nearest whole number)
	contracts Contract size (or lo	ot size)	12,500
	Exposure covered		
	f covered under put option = 17 x 12,50	= 00	£2,12,500
	\$ covered under put option = 1.7 × 2,12	,500 =	\$ 3,61,250
	\$ to be covered under forward = 3,64,8	97 - 3,61,250 =	\$ 3,647
	On a state state		
	Premium paid		
-	Put premium paid (in \$) = \$0.096		\$ 20,400
		,400 =	£13,063
	1.5	617	
iii)	Total <u>f</u> outflow		
	At max. amt payable under put = \$3,61	,250 / 1.70 =	£2,12,500
	\$ purchased under forward = \$3,647 /		£2,360
	· · ·		
	Put premium (in £)	=	£13,063

4.	Different e	expected SR	with pro	bability	<mark>y given</mark>	(6a 8
	An option is on	ly exercised if it is l	eading to favo	ourable out	come.	
		ted cost = Expected				
Ex:		ing options on \$				
a)	Call option with					
		to buy \$ at ₹76. No				
	If prevailing ma	rket price = ₹74 onli	y, then we'll di	rectly buy	from open mar	ket.
þ)	Put option with	n strike price = ₹75.				
	It means right	to sell \$ at ₹75. We	e'll use this righ	nt only if ;	\$ price < 75.	
	If \$ is trading a	at > 75, say ₹78, the	en we'll directly	y sell \$ in	open market at	78.
Ex:	Sun Ltd., an Indi	ian company will ne	ed \$ 5,00,000 in	90 days. B	orrowing rate fo	or 90-days in India = 6%.
					v	a premium of ₹0.10. Sun L

Chapter 11 **IFM Chapter Index** PART A - NPV of a foreign project PART B - Discrete topics (GDR, MIRR, A-NPV etc.) ---- Student's Space for Summary chart and notes ----

Finance I	Acharya	Jatin	Nagpal	(CA,	FRM)
1					

IFM

	PART A	forei proj	of a ign ect		
1.	NPV of a foreign project				
	Contemplating whether to invest in a foreign country or no	ot.			
	This is just like regular capital budgeting decision + some for	eign currency wi	ll be involved.		
I)	SHOULD A PROJECT BE ACCEPTED OR NOT?				
	Use NPV (Net Present Value). If NPV = Positive -> Accept.				
	NPV = Negative -> Reject				
II)	HOW TO CALCULATE NPV?				
	NPV = PVCI — PVCO				
	Cash Inflows = Project Cash flows, Subsidy, Sale of Fixe	d Assets at the o	end, release of WC.		
	Cash Outflows = Initial investment in Fixed Assets & WC, any other cash outflow.				
	Discount Rate = Weighted Average cost of capital (WAC	C)			
III)	CALCULATING FCFF (Free cash flows to Firm)	(Same as Corporate Valuation		
Step 1:	Calculate NOPAT				
	Sales		xxx		
(-)	Operating Expenses (other than dep ⁿ . & amortization)		xx		
		EBIDTA =	xxx		
(-)	Depreciation & Amortization		(××)		
		EBIT =	xxx		
(-)	Tax		xxx		
		NOPAT =	xxx		
	Important – We Do not subtract INTEREST while C	alculating NO	PAT.		
	Hence, tax is directly calculated on EBIT without subtracting	g interest.			
	,				

IFM	11.3		www	.KRIVII.IN
Step 2:	Calculate FCFF from NOPAT			
	NOPAT		xxx	
(+)	Add back: Non cash expenses like Depreciation, amort	ization	xxx	
(-)	Cash outflow: Capital expenditure	xxx		
	Increase in working capital	xxx	xxx	
(+)	Cash inflow: Sale of capital asset (Net of tax)	xxx		
	Decrease in working capital	xxx	xxx	
		F	TCFE = <u>xxx</u>	
	·			
	While cal. FCFF we do not consider any amou	nt received or p	aid to providers	of Long
	Term Capital such as - Equity Shareholders,	Debt/Loan, Pref	erence Sharehol	lders etc.
I)	Different types of Costs			(8,5)
1.	Irrelevant or sunk cost - Ignore. No role in future of	decision making. Ex:	R&D cost, product	designing etc.
	Do not subtract while calculating FMP. If already sub	tracted, then add b	ack.	
2.	Allocated fixed cost — Not to be subtracted. (Add b	ack if already subtr	acted).	
3.	Additional fixed cost — It is subtracted while calcula	ting FMP.		
4.	<u>Opportunity cost</u> — Subtract while calculating FMP.			
	Ex: Machinery currently rented out. Rental income = ₹	₹2 lacs per annum.		
	Now it will be used in an internal project Rental in	ncome forgone = 0	pportunity cost =	₹2 lacs p.a.
2.	NPV - Home Currency or FC term	<mark>IS</mark>		
l)	HOME CURRENCY APPROACH			(5)
Step 1:	Convert all Cash Flows in HC terms.			,
	Generally, question will provide Inflation data or Inte	erest rate of two c	urrencies.	
	Use -> Purchasing Power Parity Theory (when infla			
	or Interest Rate Parity Theory (when inter)	
Step 2:	Calculate NPV using above CFs (Which are in HC terms).		
(P	Discount Rate for NPV \rightarrow HC discount rate.	- -		
II)	FOREIGN CURRENCY APPROACH			
Step 1:	Calculate NPV in terms of FC only.			
<u> </u>	Use FC discount rate for NPV.			
C1 -				

Step 2: Then convert that NPV in HC terms using Spot rate.

3.	Discount Rates			
	Discount rates differs by country.			
	Discount rate for a rail project in Inc	lia ≠ Discount rate of similar project in l	JS or UK etc.	
Ex:	A US Investor wants to establish a Th	neme Park in India. The investor already r	uns theme parks in US. Fir	
	required return from Indian project i	f his required return in US is 9%.		
	Risk-free rate in US = 3%			
	Risk-free rate in India = 5%			
Ans:	METHOD 1 - SIMPLE ADDITI	ON METHOD 2 - 1	1ULTIPLICATION	
	RF + Risk premium = Required Return	$(1 + r_F) (1 + R_P) = (1 + RR)$		
	3% + RP = 9%	$1.03 \times (1 + R_P) = 1.09$		
	RP = 6%	R _P = 5.825%		
	Hence, Required Return in India = ₹RF +	. RP Hence, RR in India = 1.0	5 × 1.05825 = 11.1165%	
	= 5 + 6	= 11% This is known as Risk-adj	usted discount rate (RADA	
II)	APPROPRIATE DISCOUNT RATE		(2	
II)	APPROPRIATE DISCOUNT RATE			
	If discounting US Cash flows (i.e. in \$)	-> Use US RADR (9% in above example)		
	If discounting Indian Cash flows (i.e. in	n ₹) -> Use Indian RADR (11.1165% in above	avanala)	
			examplej	
4.	<mark>Discount Rates – Twists</mark>	; in story	exumple)	
4. I)	Discount Rates – Twists TWIST LEVEL 1 - WACC NOT GIVEN.	<mark>; in story</mark>	exumple)	
	TWIST LEVEL 1 - WACC NOT GIVEN.			
	TWIST LEVEL 1 - WACC NOT GIVEN. Discount Rate -> WACC = Ke.We + Kd.V	Vd		
	TWIST LEVEL 1 - WACC NOT GIVEN. Discount Rate -> WACC = Ke.We + Kd.V Where: Ke = cost of equity Kd = Cost of debt	Vd We = Weight of equity		
1)	TWIST LEVEL 1 - WACC NOT GIVEN. Discount Rate -> WACC = Ke.We + Kd.V Where: Ke = cost of equity Kd = Cost of debt A Co. has 40% in its capital structure	Vd We = Weight of equity Wd = Weight of debt	20%.	
1)	TWIST LEVEL 1 - WACC NOT GIVEN. Discount Rate -> WACC = Ke.We + Kd.V Where: Ke = cost of equity Kd = Cost of debt A Co. has 40% in its capital structure	Vd We = Weight of equity Wd = Weight of debt . Interest rate on debt is 10% Tax rate =	20%.	
I) Ex:	TWIST LEVEL 1 - WACC NOT GIVEN. Discount Rate -> WACC = Ke.We + Kd.V Where: Ke = cost of equity Kd = Cost of debt A Co. has 40% in its capital structure Risk-free rate = 6%. Market return is 1	Vd We = Weight of equity Wd = Weight of debt . Interest rate on debt is 10% Tax rate = 4% and beta of company's equity is 1.4. (20%.	

FM	11.5 WWW.KRIVII.IN				
II)	TWIST LEVEL 2 - UNLEVERED BETA IS GIVEN.				
	Levered (Equity) Beta = B∪ [1 + <u>D (1 - tax</u>)]				
	E				
Ex:	Let us say in above example, Equity Beta is not given. But unlevered Beta is given as 1.2.				
Ans:	Levered Beta (B _L) = $B_{\cup} [1 + D(1 - tax)]$ = $1.2[1 + 0.4(1 - 0.2)]$ = B_{\perp} = 1.84				
	or Equity Beta E 0.6				
*	Ke = R _F + (R _m - R _F) × Beta = 6% + (14% - 6%) × 1.84 = 20.72%				
*	WACC = Ke. We + Kd. Wd = 20.72 × 0.6 + 8 × 0.4 = 15.632%				
III)	TWIST LEVEL 3 – USING PROXY FIRM TO CALCULATE EQUITY BETA.				
Step 1:	Beta of a similar public Company will be given. Use it to calculate Unlevered Beta (Bu) of the sector in				
	which the company operates.				
Step 2:	Now we have B_{U} and hence can easily calculate Levered Beta (B_) of the required company.				
Ex:	A Private Co. engaged in the manufacturing of tyres has debt to equity = 1:4. Tax rate = 20%.				
	A similar Public Company has Beta = 1.55. Its D/E ratio = 2.2:1 and applicable its tax rate is 30%.				
	Find cost of equity of private company if market return (R_m) = 12% and R_F = 3%.				
Ans :	Calculating Unlevered Beta using Proxy firm (i.e. Public Co.)				
	$B_L = B_U [1 + D (1 - tax)]$				
	E				
	1.55 = B _U [1 + 2.2 (1 − 0.3)] → B _U = 0.61024				
	1				
-	Using Bu to calculate BL				
	$B_L = B_U [1 + D (1 - tax)]$				
	E				
	$B_{L} = 0.61024 [1 + 1(1 - 0.2)] = 0.732288$				
	ч				
	Hence, Levered Beta or Equity Beta of Co. = 0.732288				
	Return of Pvt. Co. (As per CAPM) = R _F + (R _m — R _F) × Beta				
	= 3% + (12% - 3%) × 0.732288				
	= 9.59%				

5.	Inflation comes into picture					
(i)	Real Cash Flows :	vs : Discount using Real discount rate.				
(ii)	Nominal Cash flows :	Discount using Nor	inal discount rate.			
	If nothing is mentioned in question, then assume Cash Flows to be "Nominal CFs".					
	Relation b/w Real & Nominal rates -> (1 + real rate) (1 + Inflation) = (1 + Nominal rate)					
Ex:	Year Real CF	Find NPV if the requ	ired return in Nominal terms is 12% p.a.	. Inflation rate 4% p		
	0 (200)					
	1 108					
	2 120					
Ans :	Method 1 - Convert Real CFs to Nominal CFs.					
	<u>Year</u> <u>Real CFs</u>	<u>Nominal CFs</u>				
	0 (200)	(200)				
	1 108	108 × (1.04) ¹ = 112.32				
	2 120	120 × (1.04) ² = 129.79.	2			
	$NPV = (200) + \underline{112.32} + \underline{129.792} = +3.755$					
	1.12	1.122				
	Method 2 - Convert nominal rate to real rate and use real rate to directly discount real CFs.					
	(1 + real rate) (1 + Inflation Premium) = (1 + Nominal rate)					
	(1 + real rate) 1.04 = 1.1	2 => Real ra	te = 7.6923%			
	NPV = (200) + _108	3 + 120 =	+3.755			
	1.076923 (1.076923) ²					
6.	VERY IMPORTANT - Rule of Consistency					
-	Discount rate should always be consistent with the cash flows.					
	Real CFs -> Real dis	scount rate	Home Currency CFs -> HC disco	ount rate		
	Nominal CFs -> Nomina	al discount rate	Foreign Currency CFs -> FC disco	ount rate		
	If only required return is given (& nothing else is mentioned) – Assume <u>Nominal HC rate</u>					
Ex:	Interpret - A Sri Lankan investor wants to invest in Bangladesh. Required return = 15%.					
	This 15% means Investor's HC NOMINAL required return i.e. Sri Lankan Nominal return.					

IFM

WWW.KRIVII.IN

7.	Handling Forex (6,8,9
I)	HOW TO SELECT RATES
.,	Recall>> Price tag rule of picking rates. (KE in-house name)
Ex :	1 Cad = 0.735\$ - 0.738\$ (Informally = Price tag of Cad)
	1\$ = <u>1</u> - <u>1</u> Cad\$ (Informally = Price tag of \$)
	0.738 0.735
-	If you are buying or selling Cad \rightarrow Just focus on 1 st quote i.e. 'Price tag of Cad'.
-	if you are buying or selling $\$ \rightarrow$ Just focus on 2 nd quote i.e. 'Price tag of $\$$ '.
(i)	Sell \$ 20,000.
	Relevant equation → 1\$ = <u>1</u> - <u>1</u> Cad\$
	0.738 0.735
	(Bid rate) (Ask rate)
	Selling \$, so Bid rate of bank applicable = 20,000 × 1 = Cad 27,100 (Approx.)
	0.738
(ii)	Buy 15,000 Cad.
()	Relevant equation → 1 Cad = 0.735\$ - 0.738\$
	(Bid rate) (Ask rate)
	= 15,000 × 0.738 = \$ 11,070
II)	Purchasing Power Parity Theory (PPPT)
	Forward Rate $A/B = \frac{SR(1 + Inflation A)}{P}$
	(1 + Inflation B)
III)	Interest Rate Parity Theory (IRPT)
	Forward Rate $A/B = \frac{SR(1 + Interest rate A)}{SR(1 + Interest rate A)}$
	(1 + interest rate B)

IFM

PART B: Discrete topics (GDR, MIRR, A-NPV etc.)

1.	GDRs (
-	Cost of GDR = <u>Total next year dividend</u> + Growth rate
	Net proceeds
	Where: Net proceeds = GDR Issue price x (1 — floatation cost)
-	GDR Issue price in HC (say ₹) = Market price per share × Number of shares in 1 GDR × (1 — discount)
-	GDR Issue price in FC (Eg , \pm) -> Simply convert issue price in HC to FC.
-	Gross amount to be raised = Net funds required \div (1 $-$ floatation cost)
Ex:	Find the issue price of GDR in \$ if current market price (CMP) of 1 share is ₹250.
	Number of shares underlying 1 GDR = 2. GDR will be issued at 10% discount. 1 \$ = ₹60.
Ans:	Issue price per GDR in ₹ = 250 × 2 × (1 — 0.1) = ₹450
	Issue price in \$ = 450 × 1/60 = \$7.5
Ex:	Cost of above GDR if next year expected dividend per share = ₹20. Growth rate is expected to be 12% p
	2% floatation cost was incurred for issuing GDRs.
Ans:	Net proceeds per GDR = 450 × (1 - 0.02) = ₹441
	Cost of GDR = 2×20 + 12% = 21.07%
	441
2.	MIRR (S
	Cash flows from a project will be re-invested at re-investment rate (will be given in ques).
	All these cash flows will be ultimately withdrawn at the end of project life.
	Such IRR is known Modified IRR (MIRR)
	MIRR = Rate at which PVCI = PVCO.
	Amount invested = <u>FV of all the cash flows</u>

IFM

Ex:	Amount invested today in project = ₹15.625 Lacs. Project's expected cash flows are as follows:					
	Year CF					
	1 4.4789					
	2 6.5313					
	3 7.0924					
	Calculate MIRR if intermediate cash flows can be re-invested at 9% p.a.					
Ans:	Year CF Value at year 3 end					
	1 4.4789 4.4789 $\times 1.09^2 = 5.3214$					
	2 6.5313 6.5313 × 1.09 ¹ = 7.119					
	3 7.0924 7.0924 \times 1.09 ⁰ = 7.0924					
	19.533					
	MIRR -> Rate at which PVCO = PVCI					
	15.625 = 19.533					
	(1+IRR) ³					
	$(1+IRR)^3 = 19.533 / 15.625$					
	MIRR = $(1.250112)^{1/3} - 1 = 7.725\%$					
3.	Adjusted NPV (11					
Step 1:	Calculate NPV of the project as if it were all equity financed — This is known as Base NPV.					
	- Do not deduct tax while calculating cash flows p.a.					
	- Discount rate to be used = Cost of equity (Ke).					
Step 2:	Calculate NPV of debt financing.					
	- Cash inflow = Raising debt.					
	- Cash outflow = Interest payments NET OF TAX + Repayment of principal.					
	- Discount rate = Market interest rate of debt (without considering tax effect).					
Step 3:	Adjusted NPV (APV) = Base NPV + PV of Impact of Financing					
Ex:	You can raise \$150 Lacs of debt at subsidized rate of 6% p.a. Market rate of such debt is 8% p.a.					
	Calculate NPV of debt financing if tax rate is 30%. Term of debt = 15 years.					
Ans:	Cash inflow = \$150L					
	Cash outflow p.a. NET OF TAX = $$150 \times 6\% \times (1 - 0.3) = $6.3L$					
	Cash outflow at the end = \$150L (repayment of principal)					
	PV of cash outflow = 6.3 × PVAF(8%, 15) + 150 × PVF(8%, 15) = \$101.1717					
	NPV of debt financing = PVCI _ PVCO = 150 _ 101.1717 = \$48.828 Lacs					

Finance Acharya Jatin Nagpal (CA, FRM)	11.10
--	-------

	Acharya Jatin Nagpal (CA, FRM) 11.10	١٢
Ex:	Project Dhyan will provide EBIDTA of \$33L p.a. for next 20 years. Initial investment = \$250 Lacs.	
	Depreciation for first 10 years will be $\$25$ Lacs p.a. and for last 10 years will be 0.	
	Tax rate is 30% p.a. Cost of equity is 12% p.a. Calculate the project NPV if -	
	Case 1 — The project the all equity financed.	
	Case 2 — Debt of \$150L is raised at 6% p.a. for 15 years. Market interest on such debt is 8% p.a.	
	i.e. Calculate Adjusted NPV in this case.	
Ans:	<u>Case 1 — Project is all equity financed</u>	
	CF of first 10 years = EBITDA (1 $-$ tax) + Tax savings on Depreciation	
	= 33 (1 – 0.3) + 25×0.3 = 30.6 Lacs p.a.	
	CF of next 10 years = EBIDTA (1 - tax)	
	= 33 (1 - 0.3) = 23.1 Lacs p.a.	
	PV of cash flows = 30.6 × PVAF(12%, 10) + 23.1 × PVAF(12%, 11-20)	
	= 172.89 + 42.0189 = \$214.9089 Lacs	
	-1/2.07 + 12.0107 - 32211.0007 Edes	
	NPV of project = PVCI _ PVCO = 214.9089 - 250 = _ \$35.091	
	The NPV is negative if the project is all equity financed.	
	So, it is not viable if the project is all equity financed.	
	Case 2 — If \$150L is financed via subsidized debt	
	NPV of debt financing = \$48.828 Lacs (already calculated in previous example).	
	Adjusted NPV of project = Base NPV (i.e. if project is all equity financed) + NPV of debt financing	
	= -35.091 + 48.828 = \$13.737 Lacs	
	Adjusted NPV is positive. Hence project is viable if subsidized debt of \$150 Lacs is raised.

2.	Settlement of	f FRA				
	M. D L D. A.			3500 1		· (, , , , , , , , , , , , , , , , , ,
Ex:					. Show the settlement of FRA	If 6 mont
	interest rate after 3		ns out to be 109	6 p.a		
Ans:	METHOD 1: Settle at					
	Settlement the end c				₹7.5 L	
		<u>1</u>	<u> 1ethod 1 – Se</u>	<u>ttle at the</u>	<u>e end</u>	
	Too	lay	3 Months		9 Months	
	6)	k9 FRA S	m rate after 3m = 6, amount won = This is decided a	: 7.5L	This Rs.7.5L will be received at the T = 9 months ✓	
	METHOD 2: Settle P	V of Amount				
	Settle PV of Amount	= 50	DOL × (10% - 7%)	x 6/12 =	₹7.143 L	
			(1 + 0.1 × 6/1	2)		
		Method 2	2 – Settle PV	ofAmount	<u>t won / (lost)</u>	
	To	oday	3 Months		9 Months	
		Bought Ar 5x9 FRA (at 7%)	mount won = 7.51		't wait for the end of period. ttle PV of 7.5 lacs at T = 3m	
			i.e. Receiv Toda		1 + 0.1 x 6/12) 143 Lacs	
I)	SETTLEMENT - WHE	N SETTLED AT E	ND			(1a&b)
	For Long = Principal x (Reference rate — FRA rate) x months/12					
	For Short = Principal ;	x (FRA rate — Re	ference rate) x	months/12		
II)	SETTLEMENT - WHEN PV IS SETTLED					(1c&d)
	FOR LONG FOR SHORT				FOR SHORT	
				D · · · I		
	Principal x (Reference	rate — FRA rate	e) x <u>months</u>	Principal x	(FRA rate — Reference rate) >	months

	Acharya Jatin Nagpal (CA, FRM)	12.4	IRRM			
III)	DISCOUNT RATE (FOR PV SETTLEMENT) = Prevailin	g rate (i.e. reference rate)				
IV)	WHICH METHOD TO FOLLOW IN EXAM?					
Case 1:	Hedging (actual a borrower or investor wants to cov					
Case 2:	In other ques (ex: Speculation) \rightarrow Show both. 1 st cal.	amount to be settled at end. The	en also cal. its PV.			
3.	FRA – Physical delivery					
	BETTING	PHYSICAL DELIVE	RY			
•	Believe interest rate will increase $ ightarrow$ Long FRA (F+)	Want to borrow in future $ ightarrow$ Lo	ong FRA (F+)			
•	Believe interest rate will decrease $ ightarrow$ Short FRA (F-)	Want to invest in future \rightarrow Sho	rt FRA (F-)			
II)	NEVER EXCHANGE NOTIONAL					
	The NOTIONAL AMOUNT IS NEVER EXCHANGED under FR	A. Only amount won/lost is NET S	ettled.			
Ex:	Mr. A want to borrow ₹200 Lacs after 3 months for	6 months. There is another party	y, Mr. B who want:			
	to invest ₹200 Lacs after 3 months for 6 months. They agree to enter into a 3x9 FRA at 8%.					
	Show the effect on each party if interest after 3 months turns out to be 6.5%.					
Ans:	There will be no exchange of principal even if the par	ties actually want to borrow or i	nvest money.			
	Mr. A -> Borrow ₹200 Lacs at 6.5% (prevailing rate) from open market.					
	Interest on loan = 200L × 6.5% × 6/12 =	₹6.5L				
+	Payment under FRA = 200L × (8% - 6.5%) × 6/12 =	<u>₹1.5L</u>				
	Total outflow: ₹8L					
	Effective interest cost of Mr. A = (8/200) × 12/6 = 8% p.a.					
	Mr. B -> Invest ₹200 Lacs at 6.5% (prevailing ra	ta) in agan markat				
	Interest on investment = $200L \times 6.5\% \times 6/12$ =	₹6.5L				
+	Receipt under FRA = 200L × (8% - 6.5%) × 6/12 =	₹1.5L				
	Total inflow: <u>₹8L</u>					
	Effective interest rate for Mr. B = (8/200) × 12/6 = 8% p.a.					
	Hence, effective interest rate for Mr. A and Mr. B is §	RY DA = FRA rate				
	inchor, effective interest fute for the A unu II. P 15 (70 p.u 1 NA TULE.				

	RRM	1
--	-----	---

4.	Pricing FRA or Calculating Forward rate (2				
I)	LOGICAL METHOD				
Ex:	Interest rates are follows:				
	Year Interest rate				
	1 10%				
	2 10.5%				
-	Find 12x24 FRA rate (i.e. forward rate after 1 year for 1 year or Simply forward rate of year 2).				
Ans:	If you want to invest ₹100 for 2 years, then there are 2 ways:				
	Alternate 1 — Invest directly for 2 years @ 10.5% p.a.				
	Investment Value after 2 years = 100 × (1.105) ² = ₹122.1025				
	Alternate 2 — Invest for 1 year @ 10% and enter into FRA for year 2.				
	Investment Value after 2 years = 100 × 1.10 × (1+FR)				
Ŧ	Logically (& as per Principal of No arbitrage) — Investment Value under both the cases shall be same.				
=>	100 × 1.10 × (1+FR) = 122.1025				
	1 + FR = 122.1025				
	110				
	FR = 122.1025 - 1				
	110				
	FR = 0.11 or 11%				
	Hence, Forward rate for year 2 shall be = 0.11 or 11%.				
	So, price (or rate) of 12×24 FRA = 11%.				
II)	DIRECT FORMULA METHOD				
	From above, we can say:				
	Forward rate = Longer effective yield -1 ×12				
	Shorter effective yield Period of FRA				
-	Solving above example:				
	Forward rate = $1.105^2 - 1 \times 12 = 0.11$ or 11%				
	1.10^1 12				

Finance Acharya.	Jatin Nagpal (CA, FRM)	

III)	CALCULATING EFFECTIVE RATE				
	If period < 12 mont	hs \rightarrow (1 + rate x months)			
		12			
	If period > 12 mont	hs → (1 + rate) ⁿ	(where n = number of compounding)		
Ex:	Rate = 12% p.a. Effe	ctive yield for:			
•	3 years = (1.12) ³ = 1.4)49			
•	9-months = 1 + 0.12	× 9/12 = 1.09			
IV)	Arbitrage if Fra	RATE ≠ FAIR RATE	(4		
Ex:	You want to invest	for 2 years. Rates are as follows:			
	Year Interest r	ate			
	1 10%				
	2 10.5%				
	A banker has quote	d 12x24 FRA at 12%. Is arbitrage possi	ible?		
Ans:	Forward rate = 1	<u>.105² - 1 × 12</u> = 0.11 or 11%			
		1.10 ¹] 12			
	Therefore, the 12×24	1 FRA rate should be 11%. Since banker	has quoted 12%, so arbitrage is possible.		
		nvest for Year 1 @ 10% Invest for Year 2 @	ERA rate LOGICAL THINKING OF ARBITRAGE		
	Investment Route 1 →		For stocks — Buy low, Sell high		
	÷		For FRA - Borrow low, Invest hig		
	0	1	2		
	Investment	Invest directly for 2 years			
	Route $2 \rightarrow$	@ 10.5% p.a.			
	Invest (via route 1) -> Invest ₹100 for year 1 @ 10% p.a. and buy FRA at 12% p.a. for year 2,				
	Borrow (via other route, i.e. route 2) -> Borrow ₹100 @ 10.5% p.a. for 2 years.				
	After 2 years				
	Investment proceed	ds: 100 × 1.10 × 1.12 =	₹123.2		
(-)	Repay loan proceeds	: 100 × 1.105 ² =	(<u>₹122.1025)</u>		
		Arbitrage p	orofit = ₹1.0975		

IRR	Μ
-----	---

5.	FRA – Other points					
I)	BID-ASK SPREAD					
	Sometimes FRA rate is given like -> Bid rate % - Ask rate %					
	Ex: If FRA given in ques is ->8% -8.5%Then this means that"Bank will buy FRA at 8% and will sell at 8.5%".					
	In other words, 'Bank will borrow at 8% and will invest at 8.5%'.					
	Customer position -> Is always opposite of bank.					
	So, if customer wants to buy FRA, then Bank will sell FRA. Rate applicable = 8.5%.					
II)	PRESENTATION OF FRA QUOTE					
	Type 1 - 6x15 FRA or 6/15 FRA or 6 by 15 FRA					
	After 6 months, we will use prevailing 9 months (i.e. $15 - 6$) rate to settle FRA.					
	Type 2 — 2v3 FRA					
	Reading style remains same. But 'v' represents years. So, this equation means:					
	After 2 years, we will use 1 year (i.e. $3 - 2$) rate to settle FRA.					

PART B: Interest Rate Gaurantee

1.	Introduction			
	We have options on stocks. Similarly, we l	have options on Interest Rates. These are also known as		
	'Interest rate Guarantee (IRG)'.			
	Stock Options	IRG. Interest rate options.		
1.	Pay premium to buy option.	Pay premium today to buy option.		
2.	Call Option (upside betting)	Cap option (Upside betting)		
	If ST > Strike price $ ightarrow$ Exercise	If interest rate (I_T) > Strike price -> Exercise		
	ST < strike price → Lapse	If I⊺ < Strike price -> Lapse		
3.	Put Option (downside betting)	Floor option (downside betting)		
	If ST < strike price $ ightarrow$ Exercise	If I _T < K -> Exercise		
	ST > strike price → Lapse	If I⊺ > K -> Lapse		
4.	Concept of lot size.	Concept of Notional amount.		
	NOTES:			
	Call option is also known as Cap option or Interest rate Cap.			
	Put option is also known as Floor option	or Interest rate Floor.		
II)	ALTERNATIVE UNDERSTANDING			
	Cap option = Right to borrow notional amount at strike rate.			
	Floor option = Right to invest notional amount at strike rate.			
(j)	Interest rate options are always net settled. Principal i.e. notional is never exchanged			
III)	OPTION PAYOFF for Buyers (6,7,8			
-	Under Call option = [Max {Notional x (Reference rate - Cap rate) x months /12, 0}			
-	Under Floor option = <i>Max {Notional x</i>	(Floor rate - Reference rate) x months /12, 0}		
IV)	PAYOFF FOR SELLER			

RM	12.9 WWW.KRIVI	1.IN		
V)	CONCEPT OF RESET DATES			
	Let us say that A co. borrowed funds at floating interest rate for 3 years. The interest rate is rese	et		
	every 6 months. Thus reset period here = 6 months. The dates on which rate is reset is known reset	date		
VI)	SINGLE PERIOD OPTIONS & MULTI-PERIOD OPTIONS			
	Single period option — Enters an option contract for only 1 period, say for next 6 months.			
	In such case, settlement will happen only once at the end of period.			
	Multi-period option — Enters an option contract for multiple periods. Say enters a contract for 2 ye	ears,		
	Interest rate will reset after every 6 months. In such case, settlement happens at every reset date	2.		
VII)	OPTION PREMIUM (5a&b	, 11)		
-	Generally paid at the time of entering into contract.			
-	While calculating Net payment or receipt under option -> Take Future value of premium paid.			
-	Sometimes in case of multi-period option, it may be decided to pay premium at every reset date.			
-	Further, sometimes amount of option premium that will be paid at every reset date is not directly	give		
	Rather, lumpsum (PV) of all the option premium is given.			
Ex:	A lumpsum premium of £200,000 will be charged by the option seller. This premium will be paid in 4 σ	equa		
	instalments of 6 months each (at each reset date). Find the instalment amount if discount rate = 6°	% p.		
Ans:	Let the amount of instalment be 'I'.			
	PV of all the instalments = $\pm 2,00,000$			
	I × PVAF (3%, 4) = 2,00,000			
	I = <u>2,00,000</u> = £53,805			
	PVAF (3%, 4)			
	Hence, directly we can say -			
	Premium per period = Lumpsum period ÷ PVAF (r%, n)			
VIII)	COLLAR STRATEGY (*	10)		
	Concept — Option buyer pays premium and seller receives premium.			
	We want to hedge our risk — say floating rate loan payments. So, we want to buy cap option.			
	Problem — We do not want to pay any option premium.			
	Solution — Buy cap (premium outflow) and sell floor (premium inflow) such that -			
	Premium received = Premium paid \rightarrow This strategy is known as 'Collar' strategy.			

	COLLAR STRATEGY FOR		
	Borrower — Buy cap, Sell floor		
	Investor — Sell cap, Buy floor		
IX)	IMP!! SLIPPERY POINT		
	Most of the times companies' borrowing rate is 'Libor + x%' or 'Mibor + x%' etc.		
	However, Option contract is almost always entered against Libor or Mibor only (& not Mibor + \times %).	•	
Ex:	You bought cap option at 7% to hedge interest outflows on your floating rate loan of Libor + 2%	6.	
	Find Net payment if Libor on reset date turns out to be 5.6%.		
Ans:	Now interest rate for company = 5.6% + 2% = 7.6%.		
	However, payoff under option will 'O'. Because cap is purchased at 7% strike against Libor.		
	And Libor rate is 5.6% only. So, no payoff under cap.		
	(A lot of students here accidentally compare option strike with Interest rate of co. — which is wro	on	

1.

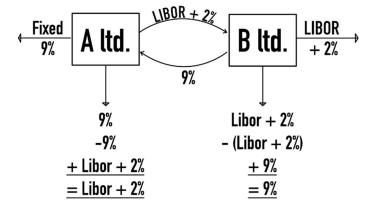

1)

Ex:

PART C: Interest Rate Swaps (IRS)
Swaps
Swap means -> अदला बदली or 'Exchange'
Swaps basically helps you in REVERSING your position.
Very informal example — You have Ladoo but wants Jalebi. Your friend has Jalebi but wants Ladoo.
You can enter into a Swap -> Exchange your Ladoo with your friend's Jalebi.
Formal example — 'reversing floating rate to fixed rate' or 'fixed rate to floating rate' using swap.
INTEREST RATE SWAPS (IRS)
A ltd> Loan of ₹100 crores. Fixed rate = 9%. Period remaining = 5 years. Interest payable bi-annually.
B ltd> Loan of ₹100 crores. Floating rate = Libor + 2%. Period remaining = 5 years. Interest = bi-annually.
Now A ltd. wants to convert its fixed loan into a floating rate loan. B ltd. wants fixed rate loan.

Arrange an IRS which will allow both the parties to achieve its desired position.

Ans: Enter into an 5-year IRS against 6-months Libor.

	$\underline{= \text{Libor} + 2\%} \qquad \underline{= 9\%}$
	Commentary:
a)	Floating leg of swap
	A ltd. will pay floating rate under the swap (Libor + 2%) -> This is known as 'floating leg' of swap.
þ)	Fixed leg of swap
	B ltd. will pay fixed rate under swap (9%) -> This is known as 'fixed leg' of swap.
	Rate of fixed leg of swap is also known as the 'PRICE OF THE SWAP'. In this ex: Price of IRS = 9

Finance Acharya Jatin Nagpal (CA, FRM)

12.12

c)	Period of swap				
	Swaps have > 1 period. In above example, we will check '6-months Libor' after every 6-months.				
	Since this is a 5-year swap, so number of periods in this swap = $2 \times 5 = 10$ periods.				
d)	Notional amount of swap = ₹100 crores.				
-	Notional is never actually exchanged under IRS.				
-	Only used for the purpose of interest calculation.				
e)	IRS are always Net settled.				
Ex:	Let us say that payment under fixed leg = ₹4.5 lacs and payment under floating leg of a swap = ₹4 lacs.				
	Then it will be net settled. Fixed leg payer pay net ₹50,000 to floating leg payer.				
Ē	Since payment are always net settled, so I can re-write above swap as:				
	Fixed 9% A ltd. 9% B ltd. 7% $+ 2%-7%$ $- Libor + 2%-7%$ $- Libor + 2%= Libor + 2%$ $= 9%$				
t)	The net effective cost under swap is also known as 'ALL IN COST (AIC)'				
	In above ex: All in Cost (AIC) of A ltd. = Libor + 2%				
	All in Cost (AIC) of B ltd. = 9%				
@ g)	PERIOD OF LIBOR				
	Which Libor to take for the purpose of calculation?				
	If interest is paid every 6-months -> Take 6 months Libor				
	If interest is paid quarterly -> Take 3 months Libor (and so on				
h)	The above is a 'Plain vanilla swap' (i.e. where one leg is fixed and other leg is floating).				

RM	12.13	WWW.KRIVII.IN		
II)	USING SWAP TO REDUCE BORROWING COST	(16, 19, 21)		
Ex:	Shinewood Ltd (Sw ltd) can borrow at either fixed rate or at floating rate .			
	Fixed rate = 8.2%			
	Floating rate = Libor + 1.5%			
	Company wants to borrow at fixed rate only. An IRS against is available at a	a price of 6.5%.		
	Can it be used to gain any advantage?			
Ans:	Option 1 — Borrow directly at fixed rate. Effective Cost = 8.2%			
	Option 2 — Borrow at floating rate and enter into IRS against Libor.			
	Floating rate payment	Libor + 1.5%		
(-)	Receive Libor under IRS	(Libor)		
(+)	Pay fixed 6.5% under IRS	<u>6.5%</u>		
	Effective cost (or All in cost) under swa	p = <u>8%</u>		
	Hence, option 2 should be preferred as it leads to lower cost.			
2.	Some Notes on Interest rate swaps (IRS)			
I)	DAY COUNT CONVENTION	(12,13)		
	For fixed leg = 30/360			
	For floating leg = Actual/360			
II)	BID – ASK SPREAD			
Ex:	Swap price quoted by bank (i.e. Interest rate of fixed leg) $ ightarrow$ 7.2% - 7.35%			
	This means -> If bank has to pay fixed rate, then it will pay 7.2%			
	If bank has to receive floating rate, then it will receive 7.35%	, (customer shall 7.35%).		
		, (customer shall 7.35%).		
Ex:	If bank has to receive floating rate, then it will receive 7.35% ANOTHER METHOD OF QUOTING SWAP RATES BY BANK			
Ex:	If bank has to receive floating rate, then it will receive 7.35% ANOTHER METHOD OF QUOTING SWAP RATES BY BANK	, (customer shall 7.35%). (This 120/135 are basis points		
Ex:	If bank has to receive floating rate, then it will receive 7.35% ANOTHER METHOD OF QUOTING SWAP RATES BY BANK Swap price = Rf + 120/135			
Ex:	If bank has to receive floating rate, then it will receive 7.35% ANOTHER METHOD OF QUOTING SWAP RATES BY BANK Swap price = Rf + 120/135 Say if Rf = 6%, then swap quote = 6% + 1.2% - 6% + 1.35%			
Ex:	If bank has to receive floating rate, then it will receive 7.35% ANOTHER METHOD OF QUOTING SWAP RATES BY BANK Swap price = Rf + 120/135 Say if Rf = 6%, then swap quote = 6% + 1.2% - 6% + 1.35%			
Ex:	If bank has to receive floating rate, then it will receive 7.35% ANOTHER METHOD OF QUOTING SWAP RATES BY BANK Swap price = Rf + 120/135 Say if Rf = 6%, then swap quote = 6% + 1.2% - 6% + 1.35%			

3.	3. Some other types of swaps			
I)	TOTAL RETURN SWAP	(15)		
	Here total return of an asset is exchanged against t	he return of another asset / benchmark index etc.		
	Rest everything is same as IRS.			
II)	OVERNIGHT INDEX SWAP (OIS)	(14a &b		
-	This is also a type of Interest rate swap — for very short duration such as 1 week.			
-	Here, the overnight index rate (floating rate) is exch	anged against a fixed rate.		
-	Imp! Floating rate under OIS is compounded daily. Whereas fixed leg rate is simple interest rate.			
4.	Swap valuation	(22, 23		
	Author note — Please revise following areas of 'Bonds' before proceeding with this section			
	i) Valuation of a floating rate bond (Value on reset o	late = Par value)		
	ii) Value of normal bond [Value = PVCI = Interest x P	VAF(r%, n) + Principal × PVF(r%, n)]		
Imp!	Do not get confused between the price of Swap and Value of swap!!!			
	Price of swap = Rate of fixed leg (simple)			
	Whereas - now we'll learn how to VALUE swap.			
	RECALL: VALUE OF ANY ASSET = PVCI			
Ex:	Consider a 5-year swap with yearly settlement.			
	Co. Fixed Bank Floating			
	GENERAL INTERPRETATION	ALTERNATIVE INTERPRETATION		
	Co. will pay fixed interest for next 5 years (PVCO)	Co. has issued fixed rate bond of 5 years.		
	And	And		
	Co. will receive floating interest for 5 years (PVCI).	Co. has invested in floating rate bond of 5 years.		
¢F	Value of swap for fixed payer (Co.) = PVCI _ PVCO = Value of floating bond (VFL) _ Value of fixed bond			
~~	Value for fixed receiver (bank) = PVCI - PVCO = Value of fixed bond (VF) - Value of floating bond (VFL)			

M	12.15		WWW.KRIVII.IN				
5.	Comparative Advantage Theory (CAT)		(17, 18, 20)				
I)	CAT - BASIC UNDER	STANDING					
Ex:		ixed rate of borrowing	Floating rate of borro	wing			
	A ltd.	12%	Libor + 5%				
	B ltd.	16 %	Libor + 6.5%				
	Advantage to A ltd.	<u>4%</u>	<u>1.5%</u>				
->	 Advantage to A ltd. is not equal in fixed market and floating market. If this advantage is Not equal -> Then we can use Interest rate swap (IRS) to our benefit. 		our benefit.				
->	A ltd. has lower interest cost in both fixed and floating market. i.e. we can say that A ltd. has ABSOLUTE ADVANTAGE in both fixed and floating markets.						
->	A ltd. has higher advantage in fixed market (4%) as compared to floating market (1.5% only). i.e. A ltd. has 'Comparative advantage' in fixed market. B ltd. has 'Comparative advantage' in floating market.		ret (1.5% only).				
II)	CAT – INTUITIVE UNDERSTANDING						
	A ltd. — Comparative Advantage in fixed market						
	A ltd — Lion in Fixed 1	narket	A ltd. — Dog in fle	Oating market			
			A ltd. is a sher (Lion) in fixed market (because it has comparative advantage in fixed market).				
		in fixed market (herause it h	as comparative advantage in	fixed market)			
	A ltd. is a sher (Lion)		nas comparative advantage in ne loan directly (on it own). 독				
-	A ltd. is a sher (Lion) If A ltd. wants to bo		ne loan directly (on it own). इ				
-	A ltd. is a sher (Lion) If A ltd. wants to bo But A ltd. is a Dog w	rrow at fixed rate -> Get th nen it comes to floating ma	ne loan directly (on it own). इ	रोर अकेला ही काफी ह			

		<u> B ltd. — Comparative A</u>	Advantage in floating market			
				•		
	B ltd — Dog in Fixed marke	et	B ltd. — Lion in floating mark	et		
	So, it can use IRS to get k	petter	So, it can borrow directly from fl	oating		
	rate in fixed market.		Market (without anyone's help i.e.	No IRS)		
III)	CAT - EXAMPLE					
Ex:	Fixed	rate of borrowing	Floating rate of borrowing			
	A ltd.	12 %	Libor + 5%			
	B ltd.	<u>16%</u>	<u>Libor + 6.5</u> %			
	Advantage to A ltd.	<u>4%</u>	1.5%			
ase A:	A ltd. wants to borrow at fixed rate.					
	B ltd. wants to borrow at	: floating rate.				
	Should they enter into an	IRS in this case?				
Case B:	A ltd. wants to borrow a	t floating rate.				
	B ltd. wants to borrow at	: fixed rate.				
	Should they enter into an	IRS in this case? Benefit	if any, will be shared equally by both th	ne parties.		
Ans:	Case A: A ltd. has comp	arative advantage in fix	ed market and wants to borrow at fixe	d rate.		
	B ltd. has comp	arative advantage in floo	ating market and wants to borrow at fl	oating rate.		
	Hence, no need to IRS in s	uch case.				
Case B:	1 st A ltd. should borrow a	t fixed rate and B ltd. sk	nould borrow at floating rate.			
	Then -> Enter into an IRS	(to achieve the desired f	ixed / floating position)			
	Max savings if IRS is enter	ed = Difference b/w adv	antage in 2 markets = 4% - 1.5% = 2.5%			
	Benefit per party = 2.5% /	′2 = 1.25% (as per ques	- benefit must be shared equally).			

	Fixed A ltd. 12% A ltd. 12% B ltd. 12% B ltd. 12% B ltd. 12% Cibor + 6.5% - 8.25% - Libor $\frac{+ \text{Libor\%}}{= \text{Libor} + 3.75\%}$ $\frac{+ 8.25\%}{= 14.75\%}$
	MOST IMP! - CALCULATION OF PRICE OF FRA
	How is the Price of FRA (i.e. fixed leg rate) of 8.25% decided?
Step 1:	<u>Calculate effective rate (AIC) of any party under IRS</u> B's Effective rate under IRS = Fixed rate without IRS — Benefit of swap = 16% - 1.25% = 14.75%
Step 2:	Back calculate FRA rate Effective fixed interest rate of B under IRS = Libor + 6.5% - Libor + FRA rate 14.75% = 6.5% + FRA rate FRA rate = 8.25%
IV)	NOTES
1.	The above example did not have any intermediary (like Bank). In case if intermediary is present, then it
	will also take away some share from the 'benefit of swap'. Let's say bank will charge 0.5% as commission
	for arranging swap.
	Then Total benefit under swap = (4% - 1.5%) — 0.5% = 2%
	This 2% benefit will be then shared between the two parties.
2.	Above example is a way of solving FRA rate under CAT. Other alternatives are also possible.

PART D: Currency Swaps

1.	Currency Swap	<mark>S</mark> (Very similar to IRS)		(28, 29,30)
	IRS -> 1 party has cor	nparative advantage in Fi	xed market	
	2 nd party has c	omparative advantage in	floating market.	
	Currency swap -> 1 par	ty will have advantage in	one currency say \$.	
	2 nd p	arty will have advantage	in other currency say ₹.	
	Imp‼ – Principal amo	unt (Notional) is actu	ually exchanged in case of c	urrency swap.
Ex:	An Indian company want	s to invest in US and req	uires \$15 Lacs. On the other han	d, a US company want
	to invest in India and rec	· · ·	T	
	Interest rates are	\$ borrowing	₹ borrowing	
	US co.	4%	14%	
	Indian co.	5%	13%	
	Can a swap be arranged t	o benefit both the parti	es? Current spot rate — 1\$ = ₹8).
Ans:	Approach to solve this q	ues is same as a CAT que	s. (Only that principal will also be	exchanged here).
	<mark>⊿II</mark>	<u>R loan</u> Indian 13% Co. \$1	2 crores \$ Interest US Co. 5 Lacs + Rs. Interest \$ 4% - \$ 4% + Rs. 13% = Rs. 13	
-	The principal will actually	cs at 4% and Indian co. be exchanged at the pre	will borrow ₹12 crores at 13%.	

	PART E: Interest Rate Futures (IRF)
1.	Interest rate futures (IRF)
	Stock futures & stock forwards → Almost same.
	But forward on interest rates (FRA) & Interest rate futures (IRF) $ ightarrow$ Very different.
I)	UNDERSTANDING IRF QUOTE
	IRF are quoted as $ ightarrow$ 100 — Interest rate
Ex:	IRF quote if prevailing interest rate is 4.6% = 100 — 4.6 = 95.4
•	If you expect interest rate increase -> IRF price will decrease -> Short futures.
•	If you expect interest rate fall -> IRF price will increase -> Long futures.
	There is INVERSE relation between IRF price and interest rate.
II)	SETTLEMENT OF IRF
11)	
II) Ex:	
	Settlement = (IRF sell rate – Buy rate)% x months/12 x Contract value x No. of contrac
	Settlement = (IRF sell rate - Buy rate)% × months/12 × Contract value × No. of contract 3-months IRF sold at 94.15. Each contract is for €50,000. Number of contracts shorted = 2000.
	Settlement = (IRF sell rate - Buy rate)% × months/12 × Contract value × No. of contract 3-months IRF sold at 94.15. Each contract is for €50,000. Number of contracts shorted = 2000. Calculate amount paid or received on IRF settlement if interest rate after 3-months turns out to be:
Ex:	Settlement = (IRF sell rate - Buy rate)% × months/12 × Contract value × No. of contract3-months IRF sold at 94.15. Each contract is for \notin 50,000. Number of contracts shorted = 2000.Calculate amount paid or received on IRF settlement if interest rate after 3-months turns out to be:Case I - 4.5% pa.Case II - 6.5% p.a.
Ex: Case I	Settlement = (IRF sell rate - Buy rate)% x months/12 x Contract value x No. of contract3-months IRF sold at 94.15. Each contract is for \notin 50,000. Number of contracts shorted = 2000.Calculate amount paid or received on IRF settlement if interest rate after 3-months turns out to be:Case I - 4.5% pa.Case II - 6.5% p.a.Interest rate = 4.5%. Price of FRA = 100 - 4.5 = 95.5
Ex: Case I	Settlement = (IRF sell rate - Buy rate)% × months/12 × Contract value × No. of contract 3-months IRF sold at 94.15. Each contract is for €50,000. Number of contracts shorted = 2000. Calculate amount paid or received on IRF settlement if interest rate after 3-months turns out to be: Case I - 4.5% pa. Case II - 6.5% p.a. Interest rate = 4.5%. Price of FRA = 100 - 4.5 = 95.5 Settlement of FRA = (94.15 - 95.5)% × 50,000 × 2000 × 3/12 = -0.3375 million
Ex: Case I	Settlement = (IRF sell rate – Buy rate)% x months/12 x Contract value x No. of contract3-months IRF sold at 94.15. Each contract is for €50,000. Number of contracts shorted = 2000.Calculate amount paid or received on IRF settlement if interest rate after 3-months turns out to be:Case II - 6.5% p.a.Interest rate = 4.5%. Price of FRA = 100 - 4.5 = 95.5Settlement of FRA = (94.15 - 95.5)% x 50,000 x 2000 x 3/12 = -0.3375 millionInterest rate = 6.5%. FRA price = 100 - 6.5 = 93.5Settlement amount = (94.15 - 93.5)% x 50,000 x 2000 x 3/12 = 0.1625 million
Ex: Case I Case II	Settlement = (IRF sell rate – Buy rate)% x months/12 x Contract value x No. of contract 3-months IRF sold at 94.15. Each contract is for \notin 50,000. Number of contracts shorted = 2000. Calculate amount paid or received on IRF settlement if interest rate after 3-months turns out to be: Case I – 4.5% pa. Case II – 6.5% p.a. Interest rate = 4.5%. Price of FRA = 100 – 4.5 = 95.5 Settlement of FRA = (94.15 – 95.5)% x 50,000 x 2000 x 3/12 = -0.3375 million Interest rate = 6.5%. FRA price = 100 – 6.5 = 93.5 Settlement amount = (94.15 – 93.5)% x 50,000 x 2000 x 3/12 = 0.1625 million
Ex: Case I Case II	Settlement = (IRF sell rate - Buy rate)% x months/12 x Contract value x No. of contract3-months IRF sold at 94.15. Each contract is for €50,000. Number of contracts shorted = 2000.Calculate amount paid or received on IRF settlement if interest rate after 3-months turns out to be:Case I - 4.5% pa.Case II - 6.5% p.a.Interest rate = 4.5%. Price of FRA = 100 - 4.5 = 95.5Settlement of FRA = (94.15 - 95.5)% x 50,000 x 2000 x 3/12 = -0.3375 millionInterest rate = 6.5%. FRA price = 100 - 6.5 = 93.5Settlement amount = (94.15 - 93.5)% x 50,000 x 2000 x 3/12 = 0.1625 millionHEDGING USING IRF(24)

	If lot size is not g	iven, then assume it	t to be 2000 bonds.		
	.				
Ex:			onths after 3 months. It wants to hedge using IRF.	•	
			period of 3 months is quoted at 94.15.		
i)		ontracts to be traded.			
ii)			ttlement if interest rate after 3-months turns out	to b	
	Case I — 4.5% pa.		– 6.5% p.a.		
iii)		each of the above case.			
Ans:	i) Number of Contrac	ts to be shorted			
	No. of contracts =	Exposure to be he	edged x Period of borrowing/Investment		
		Value of 1 lot	Maturity of futures		
	No. of contracts =	$50 \text{ million} \times 6 =$	Short 2000 contracts		
		50,000 3			
ii)	Amount received / (paid) on Settlement of IRF				
	When rate is 4.5% = 50,000 (94.15 — 95.5)% × 2000 × 3/12 = -0.3375 million				
	When rate is 6.5% = 5	0,000 (94.15 — 93.5) % × 2	2000 × 3/12 = 0.1625 million		
iii)	Calculating Net Intere	est cost under IRF	(€ million)		
	Particulars	Case I - 4.5% p.a.	Case II - 6.5% p.a.		
•	Interest on loan	1.125	1.625		
		50 × 4.5 % × 6/12	50 × 6.5 % × 6/12		
(+)	Paid under IRF	0.3375	(0.1625)		
•	Net Interest cost	1.4625	1.4625		
·	Interest cost incurre	d by Co. = (1.4625 / 50) >	× 12/6 = 5.85%		
IV)	Relation of IRF Price	and Bond price			
	Interest rate	Bond price	IRF price		
	Increase	Fall	Fall		
	Decrease	Rise	Rise		

12.20

IRRM

IRRM	12.21 WWW.KRI					
	So, if I want to hedge my bond portfolio, then -					
	Long bond portfolio -> Short IRF Short bond portfolio -> Long IRF					
2.	Cheapest to Deliver	(25)				
	IRF can be settled by (i) Net settlement (ii) Physical delivery					
I)	MECHANISM OF PHYSICAL DELIVERY					
-	Short must deliver bond to Long. Short can deliver any bond from a basket of deliverable bo	ond.				
	Ex — Let us say that any of the following bonds can be delivered by the Short					
	Bond 1 -> Coupon 7%					
	Bond 3 -> Coupon 8%					
	Bond 2 -> Coupon 6.5% \rightarrow Short will select Bond 3 as it will be cheapest.					
	But this facility is not favourable for long. So, a concept of conversion factor is introduced	l				
II)	CONVERSION FACTOR					
	Amount paid by long will depend on the quality of bond delivered by Short.					
	i.e. Amount paid by long = Futures price (F) x Conversion factor (CF)					
III)	CHEAPEST TO DELIVER - CTD					
	CTD Bond = The bond that allows short to earn maximum profit or minimize loss.					
	2 ways to find CTD bond -					
	Method 1 - Calculate profit / (loss) under each bond delivery $-$ and find CTD.					
	P&L of Short = Amount received (F x CF) — Price of bond					
	Method 2 - CTD = Spot rate of bond					
	Conversion factor					
3.	Calculation of mark to margin	(27)				
	This concept is same as 'Stock futures'. Hence, not covered again.					

PART A: Valuation of a company **Chapter overview** 1. INTRODUCTION - VARIOUS METHODS OF CORPORATE VALUATION # Profit Capitalization Method d) Cash flow per (share) basis a) b) DCF Method (Value of Co = PVCI) e) Chop — Shop Method (theoretical) c) NAV Method f) Relative valuation **COMMON SHORT-FORMS:** FCFF — Free cash flows for Firm FCFE — Free cash flows for equity V_F or V_O — Value of entire Firm V_E — Value of equity $K_{\text{E}} = \text{Cost of equity}$ Ko - Overall cost firm V_D - Value of debt Kp — Cost of debt Profit capitalization method 2. II)	Free Cash Flows to Firm (F	CFF) APPROACH			
	Calculate VALUE OF FIRM (VF	or V _o) -> PV of FCFF.			
	Discount rate to be used =	Ko = Weighted average co	ost of capital.		
	Value of equity (V _E) = Va	alue of Firm (V _o) – Va	lue of Debt (V _D)	
	Calculating FCFF				
	Concept - Almost same as	FCFE. But while Calculatin	g FCFF we do i	not consider	any amount received or
	paid to providers of Long te	erm Capital such as debt	/ loan, prefere	nce shares (etc.
	Sales				xxx
(-)	Operating Expenses (other t	han dep ⁿ . & amortization))		xx
			E	BIDTA =	xxx
(-)	Depreciation & Amortization	١			(xx)
			E	BIT =	xxx
(-)	Tax				xxx
			N	OPAT =	xxx
(+)	Add back: Non cash expenses	s like Depreciation, amort	ization		xx
(-)	Cash outflow: Capital expen	diture	XXX		
		vorking capital	xxx		xxx
(+)	Cash inflow: Sale of capito	al asset (Net Of tax)	XXX		
	Decrease in v	vorking capital	xxx		xxx
				FCFE =	XXX
4.	DCF – Notes				
I)	WEIGHTED AVERAGE COST	OF CAPITAL (K ₀)			(17a & b
2.	Ko = Ke.We + Kd.Wd + K	p.Wp			
	Where: Ke = Cost of equit	:y = Rf + (Rm — Rf).Beta			
	Kd = Cost of debt	= Interest × (1 — tax)			
	Kp = Cost of prefe	erence share capital = Rat	e of preference	e dividend (if no other info given)
	Order of preference -> 1.1	1arket value weights			
	2.	Book value weights (only	if MV are not.	available).	

	ate Valuation		13.5	WWW.KRIVII.II		
Q:	Should reserve & surplus be added while calculating weight of equity?					
A:	If using MV weights	-> Directly take MV	of equity. (no	o need to add R&S)		
	If using BV weights	-> BV of equity = F	PUSC + R&S (i.e.	R&S added while cal. BV)		
II)	SET-OFF IMPACT WH	EN DEPRECIATION =	CAPEX			
Ex:	Find cash flow if Net	profit (NP) = ₹5L. Depre	eciation = ₹80	,000 and capex = ₹80,000.		
Ans:	NP =	5,00,000				
	(+) Depreciation =	80,000				
	(-) Capex =	(80,000)				
	Cash F	ow = <u>5,00,000</u>				
	Hence, when depreciat	ion = capex, it offset	s each Other.			
_	NP = CFs (assuming n	•				
III)	DEPRECIATION ALREADY INCLUDED IN COGS (OR OPERATING EXPENSES)					
	Don't subtract again	Don't subtract again while calculating taxable profits. But add back when calculating CFs.				
Ex:	Sales =		₹50,000			
(-)	COGS (including Depred	iation of ₹10,000)	₹30,000	ightarrow No need to subtract depreciation again		
		Operating Profit =	₹20,000	(as ₹10,000 is already included in COGS		
	PAT = Operating profi	t × (1 — ta×)	₹7,000			
	But while calculating CFs -> Add back (as it is a non-cash expense) -> 7,000 + 10,000 = 17,000					
IV)	CALCULATING NOPA	T FROM NP				
IV) Ex:	CALCULATING NOPA	5,00,000				
Ex:						
	EBIT	5,00,000				
Ex: (-) =	EBIT Interest EBT	5,00,000 (1,00,000)				
Ex: (-)	EBIT Interest	5,00,000 (1,00,000) 4,00,000				
Ex: (-) = (-)	EBIT Interest EBT Tax @ 30%	5,00,000 (1,00,000) 4,00,000 1,20,000 2,80,000				

nce	Acharya Jatin Nagp	al (CA, FRM)	13.6	Corporate Value	ation		
V)	NOTES - Cash Flow						
•	Increase in CA -> Cash c	outflow	Increase in CL -> (Cash inflow			
	Decrease in CA -> Cash i	inflow	Decrease in CA ->	Cash outflow			
•	If you encounter any n	ew item in question (i.e. wh	ich is not included in al	pove format):			
	Use common sense, i.e.	If Cash inflow -> Add, if the	at item leads to cash c	outflow -> Subtract.			
5.	Concept of Gro	ss and Net invest	ment				
1)	DEPRECIATION = FUN) FOR INVESTMENT					
	Depreciation acts as a f	und that can be used for p	urchasing new assets.				
- -							
Ex:		Dep ⁿ not charged	Depreciation charg	ged			
()	Revenue	5L (21.)	5L				
(-)	COGS	(2L)	<u>(2L)</u>				
()	Operational Pr	-ofit = 3L Nil	3L	(Fill is automatically)			
(-)	Depreciation Net Prof		(<u>1L)</u> 2L ->	₹1L is automatically saved in business for			
	Net 110			(future investment)			
				(Future investment)			
->	(Continuing with above	ex.) Let us say we want to	invest ₹1.5 Lacs in fixe	d assets. (Gross Investme	ent)		
				.	,		
	₹1L is already available in business (which is saved as depreciation). New cash required = ₹1.5L — ₹1L = ₹50,000 (Net investment)						
	Net Investment (NI) = Gross Investment (G	I) – Depreciation				
	•		•				
	This is required to	Total amount	Amount available				
	be financed by	Required	internally as dep ⁿ .				
	Equity or debt etc.						
I)	GROSS INVESTMENT (GI)					
*	Gross investment (GI) =	Capex + Increase in workin	g capital				
-	If Decrease in WC -> Su	btract it from GI.					
	Alternatively, details abo	out CA/CL may be given. Ac	ljust accordingly.				

Corporate Valuation 13.					
III)	NI MAY BE FINANCED VIA DEBT OR EQUITY				
۲	(Continuing with shows ow) fushing to the import on E(

III)	NI MAY BE FINANCED VIA D	EBT OF	REQUITY				
Ex:	(Continuing with above ex.) Evaluate the impact on FCFE if the Net investment of ₹50,000 is:						
	Case A — Financed wholly by Equity Case B — Financed wholly by Debt						
Ans:	Particulars		A. 100% Equity	B. 100% debt	B. 60% Equity		
	Net profit		2,00,000	2,00,000	2,00,000		
(-)	Net investment		(50,000)	(50,000)	(50,000)		
(+)	Amount raised via debt			50,000	20,000	_	
	FCF	E =	1,50,000	2,00,000	1,70,000	_	
	or directly,						
	FCFE = NP – Net investn	nent o	fequity				
IV)	CAPITAL EMPLOYED CONCE	EPT				(13a & b)	
	(Same as above, i.e. FCFE = NP	P — NI c	of equity. Just that	; here we are taking thi	ngs on per share b	oasis.)	
Step 1:	Calculate FCFE on per share k	pasis					
	EPS			xxx			
(-)	Net investment per share x	% of e	quity	<u>(xxx)</u>			
		CF pe	r basis for equity:	xxx			
Step 2:	Value of share = CF1						
	Ke — g						
6.	NAV method					(11)	
	Value as per NAV = <u>Net assets</u> = <u>Total assets (-) External liabilities</u>						
	No. of s	hares	No.	of shares			
1.	Take Market Value (MV) of ass	sets and	d liabilities. If MV is	not available, then take	Book value.		
2.	Debenture, preference shares	s & unp	aid preference divid	lend are a part of exte	rnal liability.		
3.	Contingent liability if any sho	ould also) be subtracted.

Corporate Valuation

13.9

WWW.KRIVII.IN

9.	Impact of new project on company's Value (20					
	Value of co. (as per DCF) = PV of Net cash inflows					
	or in more refined terms, I can say ->					
	Value of co. = Net PV (NPV) of its projects					
-	So, when a new project with positive NPV is taken, then					
	New value of co. = NPV of existing projects + NPV of new project					
Ex:	Existing value of company = ₹100 crores.					
	A new project is undertaken by the co. PV of expected cash flows from new project = ₹15 crores.					
	PV of cash outflow = ₹5 crores. Find new value of co.					
Ans:	NPV of new project = 15 — 5 = ₹10 crores					
	New value of company = Existing value + NPV of new project					
	= 100 + 10 = ₹110 crores					
2.	Special case — Raising money via Equity					
	Every decision and project of co. involves some cash inflows and cash outflows.					
	However, there is 1 exception $ ightarrow$ Raising money via equity.					
	Amount raised (NET OF FLOATATION COST) = Cash inflows					
	But cash outflows = ₹0. Because when we raise money equity, then there is no liability of any cash outflo					
	Hence, raising money via equity directly increase value of company.					
	New value of co. = Existing value + Amount raised via equity (Net of floatation cost)					
10.	Enterprise value (EV) / Total enterprise value (TEV) / Firm value					
	EV represents the Market value of the business.					
-	EV = MV of equity + MV of debt + MV of pref. shares + MV of minority (-) Cash & cash equivalents					
-	Core EV or Operating EV = Total EV (-) Non-operating assets					
I)	EV MULTIPLE					
	EV Multiple =EV					
	EBITDA					
	EBITDA = Net OPERATING INCOME from CONTINUING OPERATIONS (+) Tax (+) Interest (+) Depreciation					

 Adjusted EBIDTA -> If past EBITDA is given in ques, then should be adjusted for any future chan such as _ extraordinary income/expense etc. (just like we adjust future maintainable profits). More on FMP adjustment in 'Corporate valuation' chapter. SOME OTHER SIMILAR RATIOS Price / EBITDA ratio = Price per share EBITDA per share EV / Sales multiple = EV	luation
More on FMP adjustment in 'Corporate valuation' chapter. SOME OTHER SIMILAR RATIOS - Price / EBITDA ratio = Price per share EBITDA per share - EV / Sales multiple = EV	ges
SOME OTHER SIMILAR RATIOS - Price / EBITDA ratio = Price per share EBITDA per share - EV / Sales multiple = EV	
 Price / EBITDA ratio = <u>Price per share</u> EBITDA per share EV / Sales multiple = <u>EV</u> 	
 Price / EBITDA ratio = <u>Price per share</u> EBITDA per share EV / Sales multiple = <u>EV</u> 	
EBITDA per share - EV / Sales multiple = EV_	
- EV / Sales multiple = <u>EV</u>	
Jules Jules </td <td></td>	
Image: Section of the section of th	
Image:	

PART B: EVA, MVA

	EVA helps us in evaluating a company's financial performance.			
	Co. generates 'value' only if returns > cost of capital invested.			
	EVA = NOPAT – (WACC × Invested capital)			
I)	CONCEPT OF ECONOMIC ASSETS UNDER EVA			
-	Marketing exp, Patents, copywrites etc -> These are not expense but rather ECONOMIC ASSETS .			
-	Do not write off these expenses in P&L.			
-	These become part of 'Invested capital'.			
-	Depreciation is provided on these Economic assets. This depreciation is deducted from P&L.			
-	Depreciation to be provided on the basis of 'Economic life' of asset.			
II)	NON-CASH EXPENSES ARE NOT EXPENSES			
	Non-cash expenditure (other than depreciation & amortization) is not treated as expenditure by EVA.			
	So, add back any such non-cash expense given in ques. Ex: Provision for doubtful debt (PFDD).			
III)	NOPAT CALCULATION			
	EBIT (1 $-$ tax)			
(+)	Any non-operating income (net of tax)			
	Ex: Interest received from marketable securities			
(+)	Non-cash expenditure (other than depreciation & amortization)			
	Ex: Any provision for doubtful debt MADE DURING THE YEAR			
(+)	Remaining value of any economic asset (which otherwise is fully written off)*			
IV)	WACC			
	WACC = Weighted average Cost of Capital = Ke.We + Kd.Wd + Kp.Wp			

Finance Acharya Jatin Nagpal (CA, FRM) 13.12

Corporate Valuation

3.	INVESTED CAPITAL (= CE + Some EVA of	adjustments)
	Capital employed (CE) as per Balance sheet (Note below)	xxx
(+)	Non-cash liabilities & provisions — Ex: Provision for doubtful debts	xxx
(+)	Market value / Economic value of assets not included in balance sheet — Ex: Patents	xxx
(-)	Market value of liabilities not included in balance sheet	(xxx)
(-)	Non-operating assets — Ex: Investment property	(xxx)
(-)	Assets without any economic value (unamortized floatation cost, P&L debit balance etc.)	(xxx)
	Invested capital =	xxx
IV)	CAPITAL EMPLOYED	
	From assets side -> Total assets (-) Current liabilities, provisions etc.	
	From Liabilities side -> Equity Share capital + Reserve & surplus + Pref. Share capital + Long ter	m debt
2.	Market Value Added (MVA)	(32, 33)
	MVA = MV of Firm — Capital employed	
Or	MVA = MV of equity - Book value of equity	
3.	Notes	
1.	EVA Dividend =EVA	
	No. of shares	
2.	Financial leverage of company = EBIT or EBIT	
	EBT EBIT — Interest	

Chapter 14 M&A

PARTA - Basics of M&A

PART B - Calculating SER

PART C - Tiny Topics

---- Student's Space for Summary chart and notes ----

	PART A: Basics of M&A	
1.	Introduction	
	$F_{\text{Big Itd.}} + F_{\text{Tiny Itd.}} = F_{\text{New Itd.}}$	
I)	DIFFERENCE BETWEEN MERGER & ACQUISITION	
	Merger -> Vodafone + Idea = Vodafone Idea	
	Acquisition = Facebook → WhatsApp = Facebook	
II)	WHY COMPANIES MERGE? (SYNERGY)	
	Merger often leads to benefit of synergy.	
	When companies merge, they can expect higher profits (due to synergy). This can be due to	
<u>a.</u>	Reduced operational costs.	
þ.	Increase in revenue.	
Note:	General tone for examples in this chapter:	
	Big Itd will acquire Tiny Itd. The new entity will be called New Itd.	
III)	SYNERGY TYPE 1 – SYNERGY IN EARNINGS	
	i.e. Increase in earnings due to merger.	
Ex:	Earnings of Big ltd (E _{Big}) = ₹500. Earnings of Tiny ltd (E _{Tiny}) = ₹200. Increase in Earnings due merger = ₹ 100	
	New total earnings = 500 + 200 + 100 = 800	
Ex:	Earnings of Big ltd (E _{Big}) = ₹500. Earnings of Tiny ltd (E _{Tiny}) = ₹200. Increase in Earnings due to merger = 10% New total earnings = 500 + 200 + (500 + 200)×10% = ₹770	

MŧA	14.3 WWW	/.KRIVII.IN
IV)	SYNERGY TYPE 2 – SYNERGY IN MARKET VALUE	
	i.e. Increase in Market value due to merger.	
Ex:	: MV of Big ltd (EBig) = ₹10,000. MV of Tiny ltd (ETiny) = ₹6,000. Increase in MV due to synergy b	penefits = ₹1500
	New total MV = $10,000 + 6,000 + 1,500 = ₹17,500$	
Ex:	: MV of Big ltd (EBig) = ₹10,000. MV of Tiny ltd (ETiny) = ₹6,000. Increase in MV due to synergy k	penefits = 20%
	New total MV = 10,000 + 6,000 + (10000 + 6000)×20% = ₹19,200	
2.	Modes of Acquisition	
I)	CASH ACQUISITION	
-	Cash will be paid to SHs of Tiny Itd.	
-	No new shares are issued in this case.	
-	Amount of cash to be paid to the SHs of Tiny Itd will be given in question.	
-	Number of shares in New Ltd. = Number of shares in Big ltd.	
II)	 SHARE ACQUISITION Shares of New entity will be issued to SHs of Tiny ltd. New shares are issued in this case as per swap ratio (also known as share exchange ratio) 	
-		
-	 Swap ratio (Share exchange ratio) - (a) Maybe given directly in question 	
	(b) We may need to calculate SER.	
_	$\left[N_{New} = N_{Big} + N_{Tiny} \times SER \right]$	
Ex:	Big ltd is planning to acquire Tiny ltd. The proposed swap ratio / Share exchange ratio (SER) is 0.5:1.
	Number of shares in Big ltd. (N $_{Big}$)= 20,000 and in Tiny ltd (N $_{Tiny}$) = 10,000.	
Ans:	This means that Big ltd. (acquirer) will issue 0.5 shares for every 1 share in Tiny ltd. (target).
	Big ltd. will issue = 10,000 × 0.5 = 5,000 shares.	
	Total number of shares in new entity (N _{New}) = 20,000 + 5,000 = 25,000	
	or directly - N _{New} = N _{Big} + N _{Tiny} × SER = 20,000 + 10,000 × 0.5 = 25,000	

3.	Some Imp post-Merger figures
、	
I)	TOTAL EARNINGS OF NEW ENTITY (ENEW)
	Enew = Earnings of Big (E _{Big}) + Earnings of Tiny (E _{Tiny}) + Synergy benefits
Ex:	Earnings of Big ltd (E _{Big}) = ₹50L. Earnings of Tiny ltd (E _{Tiny}) = ₹20L.
	Benefits of synergy i.e. increase in earnings due to merger = ₹10L. Find total earnings of New Ltd (E _{Nev}
Ans:	E _{new} = 50L + 20L + 10L = ₹80 lakhs
II)	EPS OF NEW LTD (EPSNEW) OR EPS OF MERGED ENTITY
	EPS _{new} = <u>Total earnings after Merger</u>
	Total number of shares after Merger
	EPS _{new} = E _{Big} + E _{Tiny} + Synergy
	N _{Big} + N _{Tiny} × SER
Ex:	Number of shares of Big ltd = 500, Earnings of Big ltd = 10,000
-	Number of shares of Tiny ltd = 400, Earnings of Tiny ltd = 6,000
-	Find EPS after Merger if SER = 0.5:1 & Synergy = 1500.
Ans:	EPS after merger i.e. EPS _{New} = <u>10,000 + 6,000 + 1500</u> = ₹25 per share
	500 + 400×0.5
III)	MPS & Market Value (MV) - WHEN PE RATIO IS GIVEN
•	$MPS_{New} = EPS_{New} \times PE_{New}$ $MV_{new} = MPS_{New} \times N_{New}$
-	If EPS _{New} is not directly given, then calculate it using above concepts.
-	PE ratio of merged entity (a) If is given specifically -> Use that
	(b) If nothing specific is given -> Use existing PE ratio of Big ltd.
Ex:	Find MPS & total MV of New ltd. if EPS of New ltd. is expected to be ₹30 and PE ratio of New ltd. = 12.
	Total number of shares in merged entity = 20,000.
Ans:	MPS _{New} = 30 × 12 = ₹360

MŧA

IV)	MPS & MV - When MV of Big & Tiny are given (But PE Ratio Is Missing)	
	<u></u>	
•	MV _{new} = MV _{Big} + MV _{Tiny} + Increase in MV due to synergy	
•	MPS _{New} = Total MV after merger = MV _{Big} + MV _{Tiny} + Synergy	
	Total Number of shares after merger N _{Big} + N _{Tiny} × SER	
Ex:	MV of Big ltd (MV _{Big}) = 50,000. MV of Tiny ltd (MV _{Tiny}) = 30,000. Synergy = 5,000. Find MV of New ltd (MV _{New})	
Ans:	$MV_{new} = 50,000 + 30,000 + 5,000 = 85,000$	
Ex:	: Calculate MPS _{new} if MV _{Biq} = 40L, N _{Biq} = 10,000. MV _{Tiny} = 15L, N _{Tiny} = 8,000. Synergy = 5L. SER = 0.625:1.	
Ans:	MPS _{new} = <u>4</u> 0 lakhs + 15 lakhs + 5 lakhs = 400	
	10,000 + 8000×0.625	
	NOTES:	
1.	Answers from different methods can differ.	
2.	If PE ratio is given in ques (or any hint related to PE ratio is given), then use MV_{new} = $MPS_{New} \times N_{New}$	
V)	EQUIVALENT MPS OF TINY LTD.	
	Equivalent MPS _{Tiny} = MPS _{New} x SER	
Ex:	MPS of new ltd = ₹60. SER = 0.6:1. Find equivalent MPS of Tiny ltd	
Ans:	Equivalent MPS = 60 × 0.6 = ₹36	
	Understanding the above:	
	If I had 10 shares of Tiny ltd. After merger, I will receive 6 shares of New ltd. (as SER = 0.6:1).	
	MPS of New Itd = ₹60. My total value of shares in New Itd. = 6 x 60 = 360.	
	i.e. I got ₹360 worth of shares in New ltd. against my 10 shares in Tiny ltd.	
	or I can say my Equivalent MPS = 360/10 = ₹36	
VI)	EQUIVALENT EPS OF TINY LTD.	
	Equivalent MPS = MPS _{New} x SER	
Ex:	EPS of New ltd. = ₹15. SER = 0.4 : 1. Find Equivalent EPS.	

	PART B: Calculating SER
1.	3 Ways of calculating SER
I)	ON THE BASIS OF - EPS, MPS, BVPS, NAV ETC.
	SER = EPS of Tiny ÷ EPS of Big
	Similarly, for MPS, BVPS, NAV etc. i.e. SER = <u>MPS or BPVS or NAV of Tiny</u>
	MPS or BVPS or NAV of Big
Ex:	EPS of Big ltd = ₹20. EPS of Tiny ltd = ₹10. What should be the SER?
Ans:	SER = 10 = 1 = 0.5:1
	20 2
II)	ON THE BASIS OF - WEIGHTS
	SER in this case = Weighted average of various SERs. Details will be given in ques.
Ex:	Find SER if the weights of EPS, MPS & NAV are 30%, 50% & 20% respectively. Details are:
	Particulars Big ltd. Tiny ltd.
	EPS 20 5
	MPS 800 500
	NAV 600 300
Ans:	Calculation of SER on the basis of:
-	$EPS = \underline{EPS}_{Tiny} = \underline{5} = 0.25:1$
	EPS _{Big} 20
-	MPS = <u>MPS_{Tiny} = 500</u> = 0.625:1
	MPS _{Big} 800
	NAV = NAV _{Tiny} = 300 = 0.5:1
-	1040 - 1040 [mg - 300 - 0.3.1

ΜŧΑ	
-----	--

III)	WEIGHTS IN CASE OF A ' BAD' RATIO	
	EPS, MPS, BVPS, NAV etc> These are all good ratios i	e. we want these to be High.
	But sometimes a negative ratio may be given in que	s such as Gross NPA ratio (GNPA).
	We informally call it a bad ratio because we want GN	IPA to be less.
	SER in such cases (of bad ratios) = <u>Bad ratio of Big</u>	
	Bad ratio of Tiny	
Ex:	GNPA of Bank A is 10% whereas GNPA of bank B is 40)%. What should be SER based on GNPA?
Ans:	SER = $\underline{\text{GNPA of Bank A}}$ = $\underline{10}$ = 0.25:1	
	GNPA of Bank B 40	
2.	4 Special cases of calculating SE	D

Total earnings of Big ltd. (EBig) = 2500, Total earnings of Tiny ltd. (ETiny) = 500, Synergy benefits = 500
Number of Shares of Big ltd (N_{Big}) = 1000 shares, Number of Shares of Tiny ltd (N_{Tiny}) = 600 shares
Find the SER or Swap ratio is SHs of Big ltd. do not want to sacrifice on their current EPS.
EPS _{Big} = 2500/1000 = 2.5
EPS _{new} = <u>E_{Big} + E_{Tiny} + Synergy</u>
NBig + NTiny × SER
2.5 = 2500 + 500 + 500
1000 + 600 × SER
1000 + 600 × SER = 3500/2.5
SER = 0.6667 : 1
CONDITION TYPE 2 - SHs of Big ltd. does not want to sacrifice on their current MPS
MPS _{Big} = MPS _{New}
MPS _{Big} = <u>MV_{Big} + MV_{Tiny} + Synergy</u>
N _{Big} + N _{Tiny} × SER
MV of Big ltd (MV _{Big}) = 16,000 ; MV of Tiny ltd (MV _{Tiny}) = 5,000
Benefits of synergy i.e. increase in MV due to merger = 3,000
Number of Shares of Big ltd (N_{Big}) = 800 shares ; Number of Shares of Tiny ltd (N_{Tiny}) = 500 shares
Calculate the SER if SHs of Big ltd. do not want to sacrifice on their current MPS.
MPS _{Big} = MPS _{New}
16000 = 16,000 + 5000 + 3000
800 800 + 500 × SER
20 = 24000
800 + 500 × SER
800 + 500×SER = 24000/20
SER = 0.8:1

ΜŧΑ	14.9 WWW.KRIVII.IN
	SCENARIO 2: CONDITIONS PUT BY SELLER CO. IT WILL DECIDE THE MINIMUM NUMBER
	OF SHARES THAT TARGET CO. IS WILLING TO ACCEPT.
III)	CONDITION TYPE 3 – SHs of Tiny ltd. does not want to sacrifice on their current EPS
	Quite similar to condition type 1, but with one important difference.
	We need EQUIVALENT EPS of Tiny ltd. in this case.
	EPS _{Ting} = Equivalent EPS in Merged firm
	EPS _{Ting} = EPS _{New} × SER
	LIGING LIGNEW X OLK
	$EPS_{Tiny} = \underbrace{E_{Biq} + E_{Tiny} + Synergy}_{XSER} \times SER$
	NBig + NTiny × SER
	->
Ex:	Cal. minimum SER that Tiny ltd. will accept if it does not want to sacrifice on their current EPS.
	Earnings of Big ltd (E _{Big}) = ₹28,000 ; Earnings of Tiny ltd (E _{Tiny}) = ₹14,000 ; Benefits of synergy = ₹7,000
	Number of Shares of Big ltd (N_{Big}) = 2000 shares ; Number of Shares of Tiny ltd (N_{Tiny}) = 1000 shares
Ans:	EPS _{Tiny} = Equiavlent EPS of New ltd.
	$\frac{14000}{14000} = \frac{28000 + 14000 + 7000}{14000 + 7000} \times SER$
	1000 2000 + 1000×SER
	14 = 4900 × SER
	2000 + 1000 × SER
	2000 + 1000×SER = <u>49000 × SER</u>
	14
	SER = 0.8:1
IV)	CONDITION TYPE 4 - SHs of Tiny ltd. does not want to sacrifice on their current MPS
,	Need EQUIVALENT MPS of Tiny ltd. in this case.
œ	MPS _{Tiny} = Equivalent MPS in Merged firm
	$MPS_{Tiny} = MPS_{New} \times SER$
	Note - Calculation of MPSNew is already before. Refer that section in case of any doubt.

	PART C: Tiny Topics		
1.	Gain / loss due to Merger		
	Equivalent EPS / MPS after merger xxx		
(-)	EPS / MPS before merger (xxx)		
	Gain / loss due to merger <u>xxx</u>		
Note:	If ques asks to calculate gain or loss to SHs, then should we calculate it in EPS terms or in MPS terms?		
Ŧ	The answer will depend upon the framing of the ques. If ques is centric around EPS, then in EPS terms		
	or if ques is centric towards MPS, then calculate in MPS terms.		
E× 18:	Earnings _{Big} = 500, Earnings _{Tiny} = 200, N _{Big} = 100, N _{Tiny} = 50. SER = 0.6:1. Synergy benefits = 80.		
	Calculate gain or loss to the SHs of both the companies.		
Ans:	$EPS_{New} = \frac{500 + 200 + 80}{6} = 6$		
	100 + 50×0.6		
#	Calculating Gain or loss to SHs Big Itd. Tiny Ltd.		
	Equivalent EPS / MPS after merger 6 6 x 0.6 = 3.6		
(-)	EPS / MPS before merger (5) (4)		
	Gain / (loss) due to merger <u>1</u> <u>(0.4)</u>		
2.	Cash Takeover / Leveraged Buyout		
i)	Source of cash = Borrowed funds		
,	Deduct Interest (after tax) on such borrowed funds from the earnings of the merged entity.		
ii)	Source of cash = Business itself		
	The income lost (post tax) due to cash purchase (i.e. opportunity cost of cash) will be deducted from		
	the earnings of the merged entity.		

1ŧA	14.11	WWW.KRIVII.IN			
Ex:	Earnings of Big ltd = 5000 and that of Tiny ltd is 3000. Big ltd	is planning to acquire Tiny ltd. Consideration			
	of ₹15000 will be paid in cash to Tiny ltd. Find the earnings of	f the merged entity if tax = 30%.			
	Case i) Cash is borrowed from a bank at an interest rate of	10%.			
	Case ii) Big ltd. already has surplus cash, which is current inve	ested at 7%.			
Ans:	Case i) Funds are borrowed at 10%				
	Earnings of Big ltd.	5000			
	Earnings of Tiny ltd.	3000			
	Less: Post tax interest — 15000 × 10% × (1-0.3)	<u>(1050)</u>			
	Earnings of Merged Entity	<u>6950</u>			
	Case ii) Surplus Funds are invested at 7%				
	Earnings of Big ltd.	5000			
	Earnings of Tiny ltd.	3000			
	Less: Earnings lost — 15000 × 7% × (1-0.3)	<u>(735)</u>			
	Earnings of Merged Entity	<u>7265</u>			
3.	Percentage Holding in New Ltd.				
0.					
Ex:	Number of shares of Big ltd. = 20,000 ; Number of shares	s of Tiny ltd. = 10,000			
	SER = 0.5:1. Find percentage holding in new holding.				
Ans:	Number of shares issued to Tiny ltd = 10,000 × 0.5 = 5,000				
	Total number of shares of New ltd. = 20,000 + 5,000 = 25,000				
	Big ltd = 20,000/25,000 = 80%				
	Tiny ltd. = 5,000/25,000 = 20%				
	Using similar logic, you can also find percentage of promoter holding in New ltd.				
4.	Net or True cost of merger				
	Net Cost of merger = What is paid — What is received.				
I)	CASH TAKEOVER				
	Net Cost = Cash paid — MV of Tiny Ltd. received.				
	SHARE TAKEOVER				
II)					

Finance Acharya Jatin Nagpal (CA, FRM)

	5. When g or CFs changes under New Management					
I)	WHEN GROWTH RATE (g) CHANGES UNDER NEW	MANAGE	MENT			
1.	For calculating post-merger MV> Use value based	d on new	growth rate (like MPS of Tiny w	vith new 'g'		
2.	For calculating benefits to SHs of Tiny ltd> Use	their old	growth rate only.			
3.	This increase in value (due to increased growth rate under management) = Benefits of synergy					
Ex:	MV of Big ltd. = ₹3600.					
	MV of Tiny ltd. under old management (at current	growth	rate) = ₹480			
	MV of Tiny ltd. under new management (at increas	sed growt	h rate) = ₹960			
->	Hence, we will try to negotiate with Tiny ltd. at a	minimum	value of ₹480.			
	However, the maximum value that we may give to	o Tiny ltd	. = ₹960.			
->	Benefit of synergy = MV of New - (MV of Big + M	1V of Tiny)			
	= 3600 + 960 (3600 + 480) = 3	₹480				
II)	NEGOTIATING					
	Max amount that Big can pay = PVCI of Total Benefits from Tiny					
	<u> </u>		/			
	These TOTAL BENEFITS will also include benefits	s of syner	gy.	s own'		
	<u> </u>	s of syner	gy.	sown']
